

# MEI-YU OF TAIWAN: WHAT'S THE BECOMING OF IT?

Simon Wang 王世宇, Utah Climate Center  
Utah State University, USA

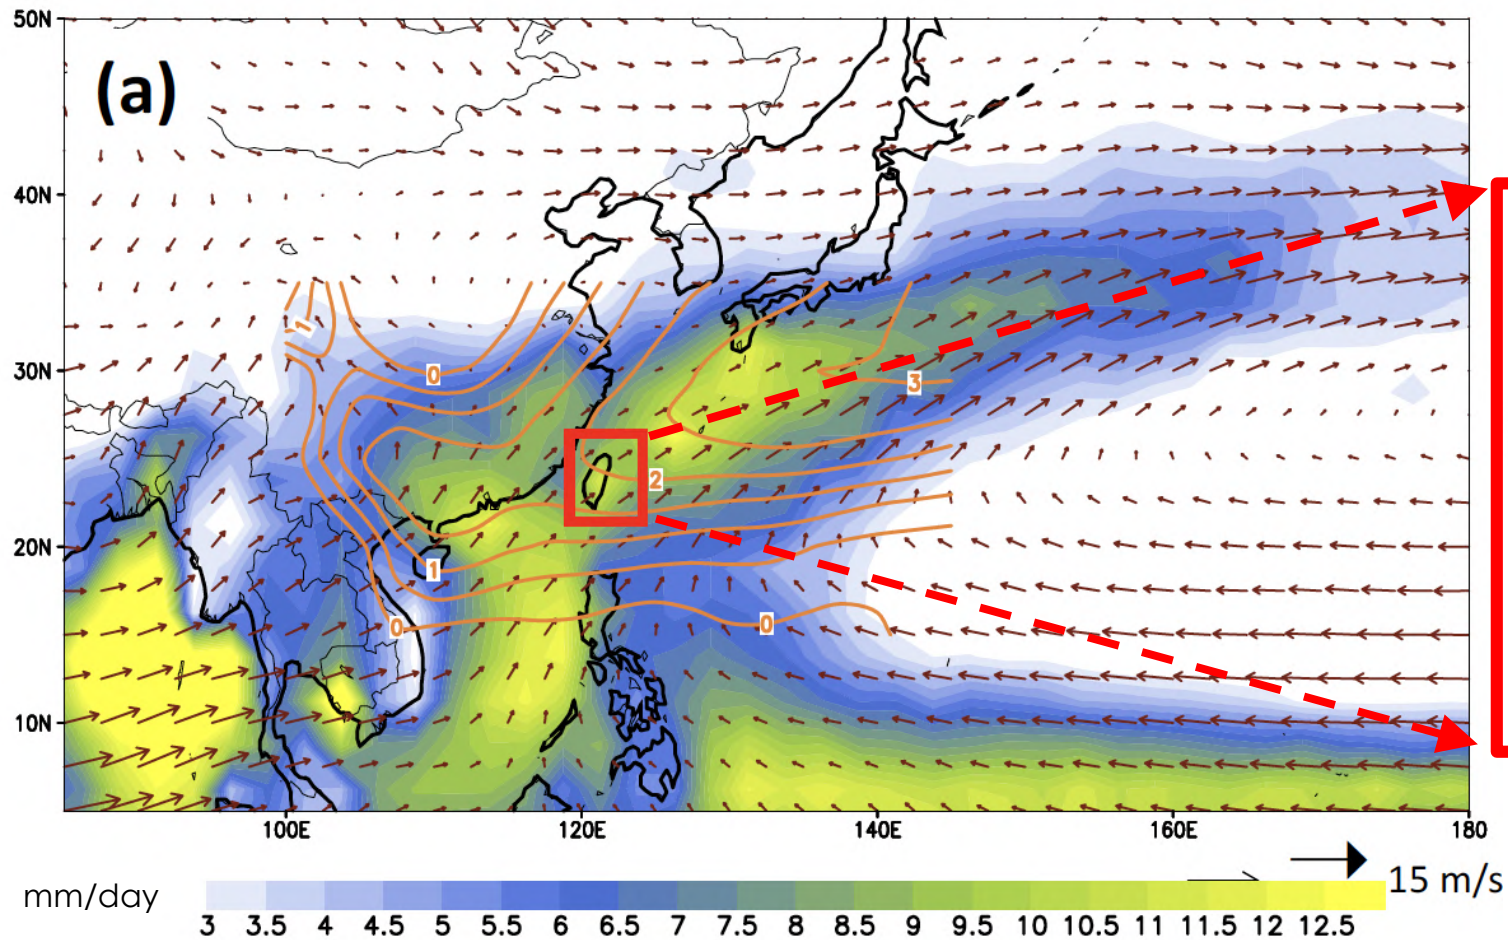

台灣的梅雨季到底是何時？

WHEN EXACTLY IS THE MEIYU SEASON?

(in Taiwan?)

# LET'S REVISIT:

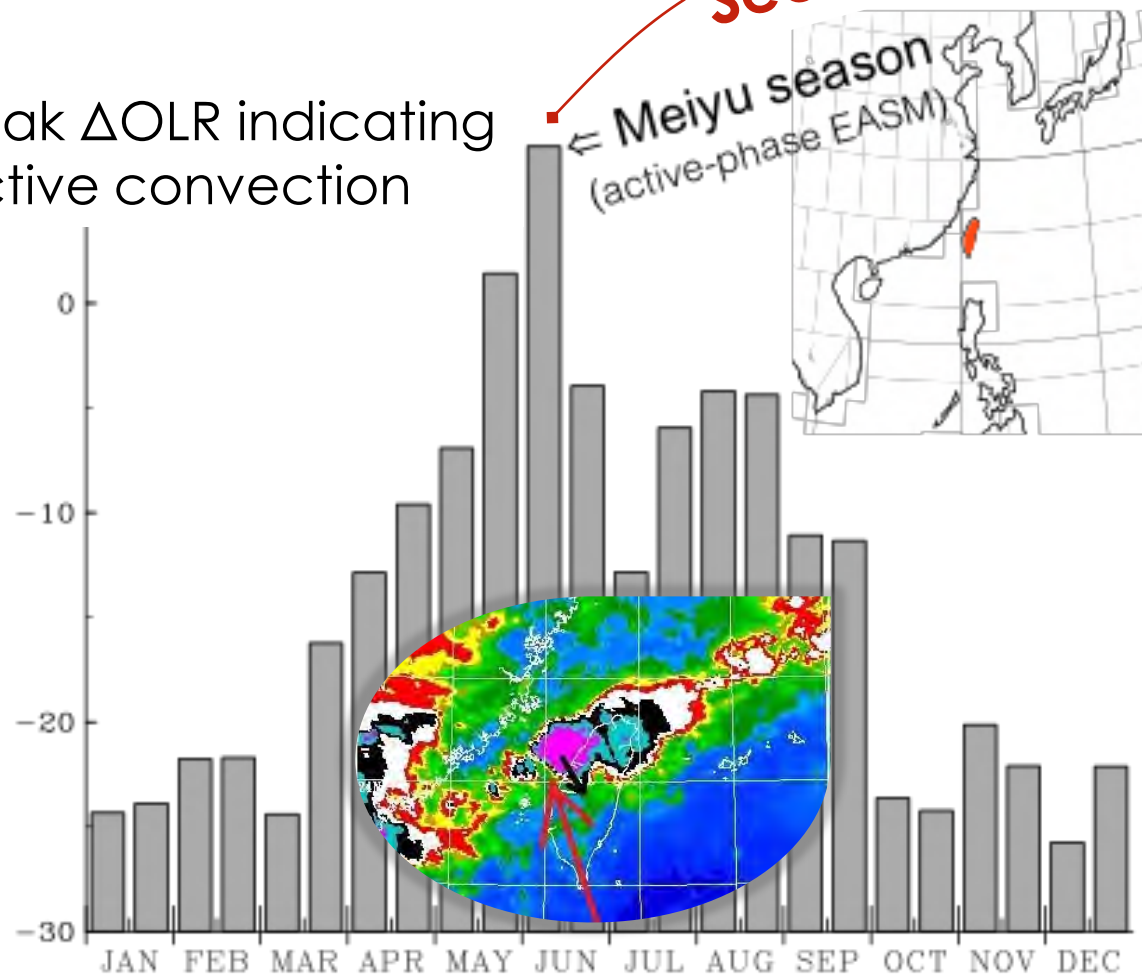

5-day mean normalized precipitation  
(1981-2000)

Seems like in early June!

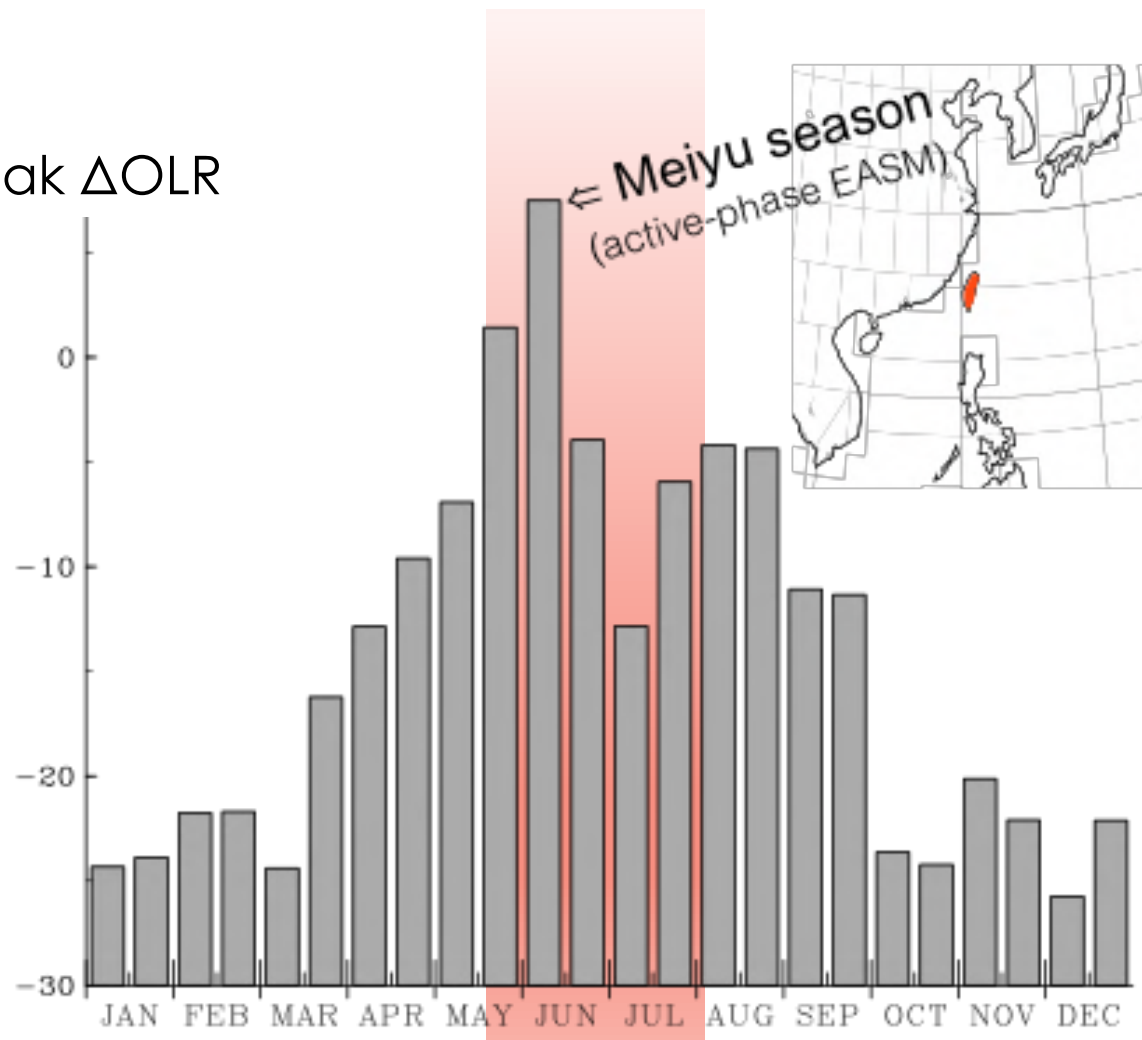

LET'S REVISIT:

Peak  $\Delta$ OLR indicating active convection

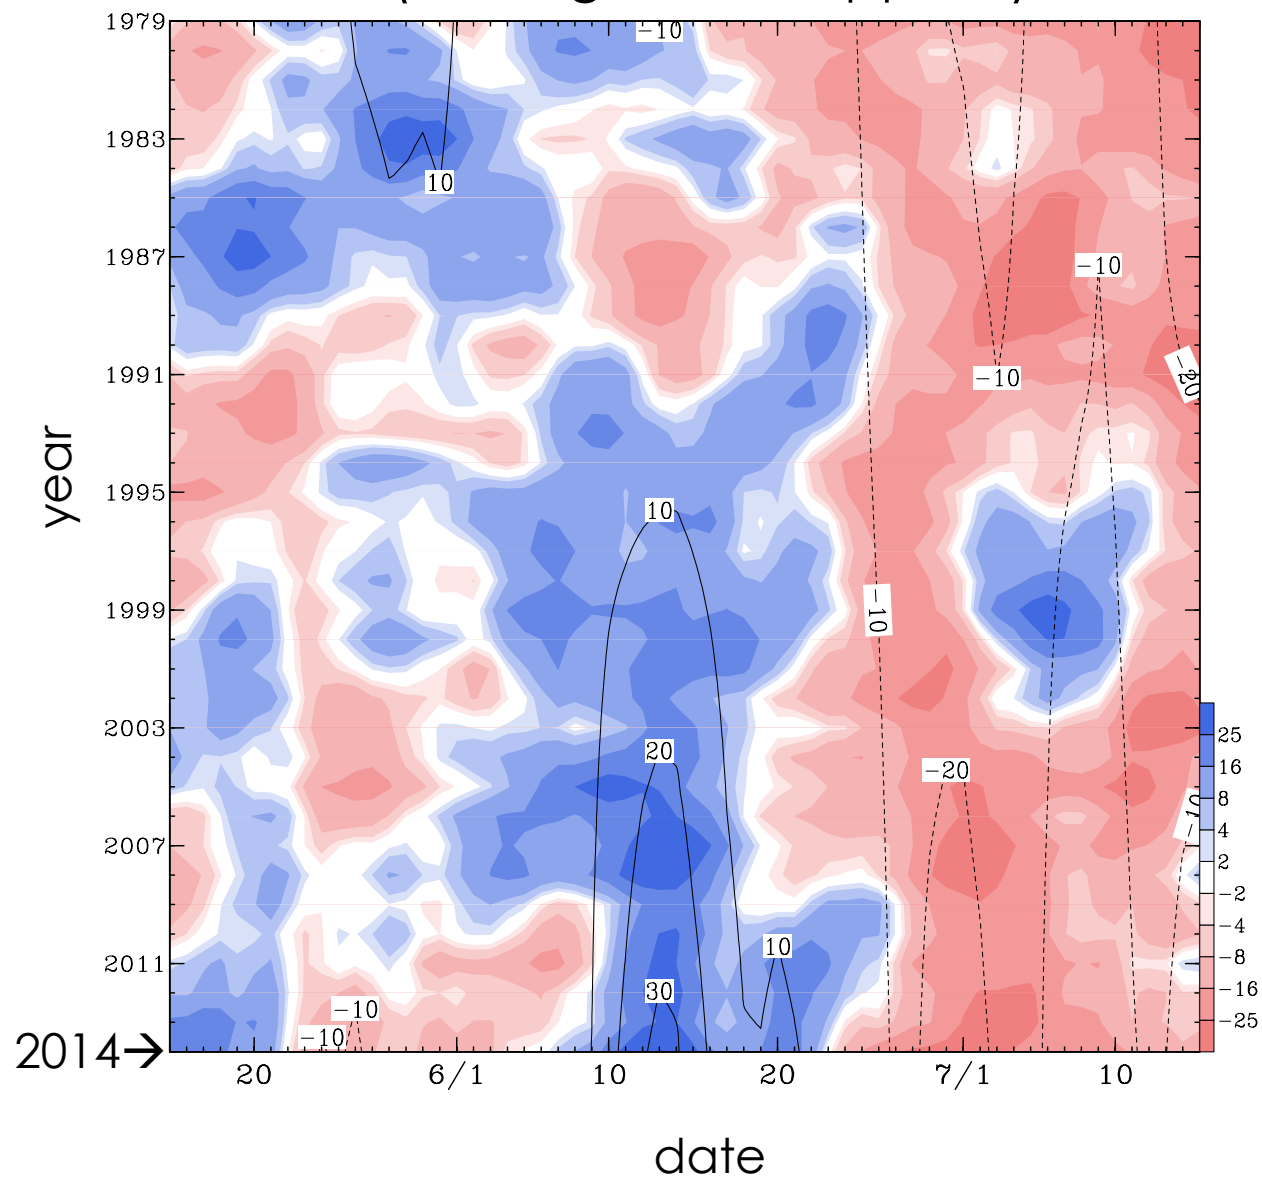

5-day mean normalized precipitation  
(1981-2000)

Peak  $\Delta$ OLR

Each year's peak daily  $\Delta$ OLR  
(running means applied)

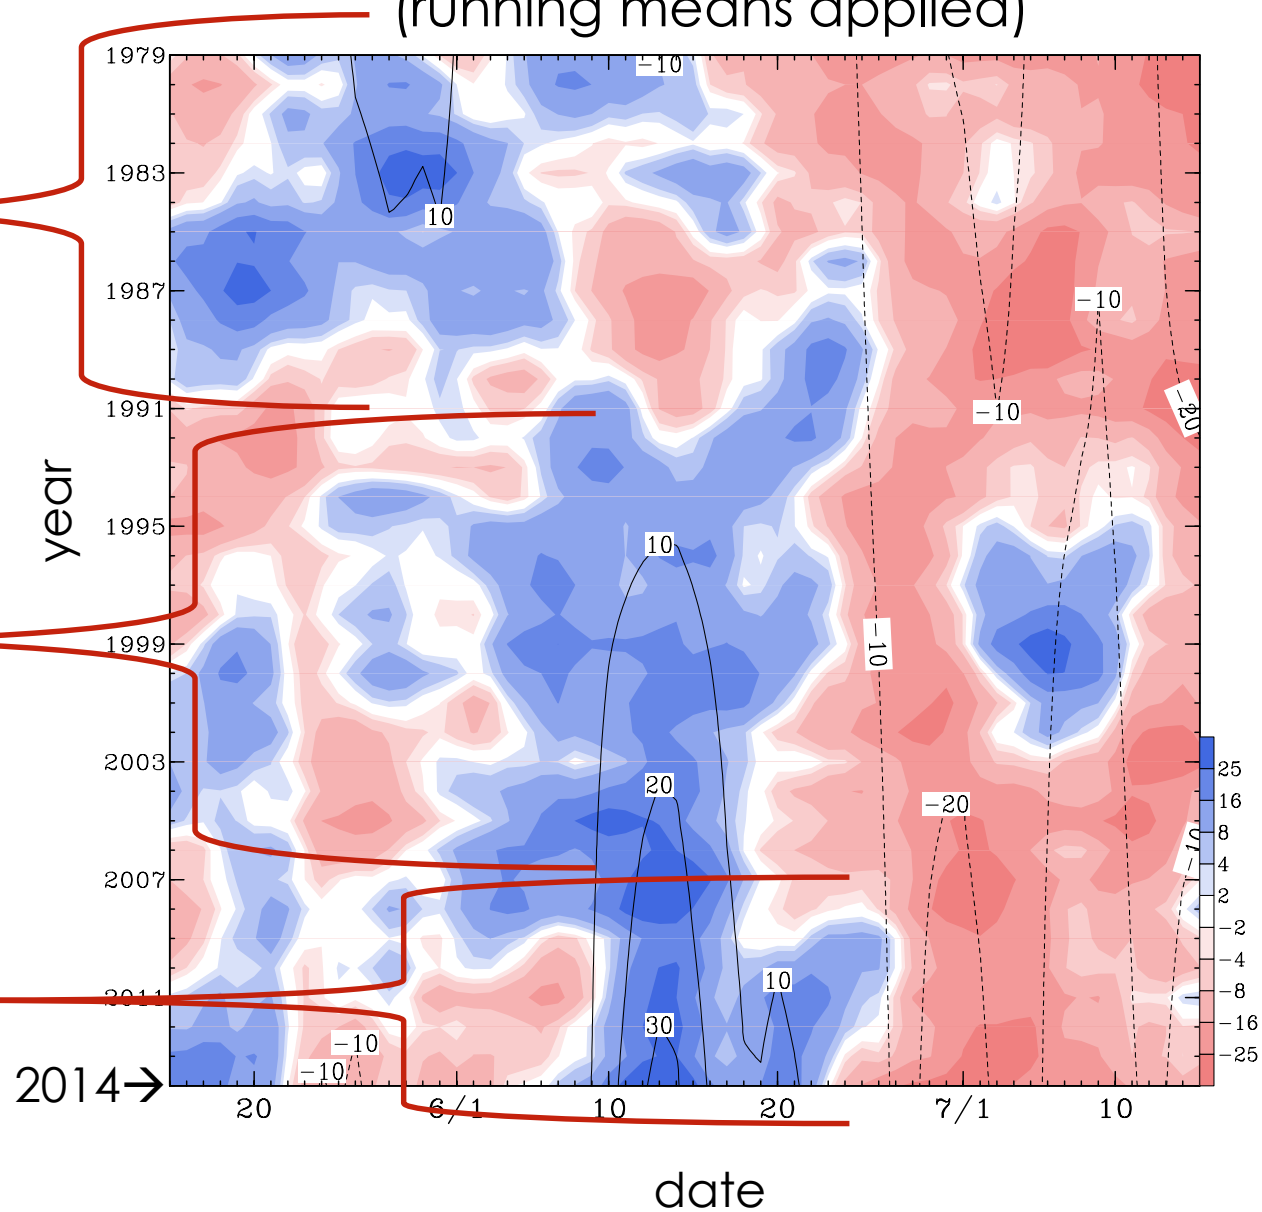

Each year's peak daily  $\Delta\text{OLR}$   
(running means applied)

Textbook Meiyu Season

Shifted Meiyu (same length)

Enhanced Meiyu (& shortened)

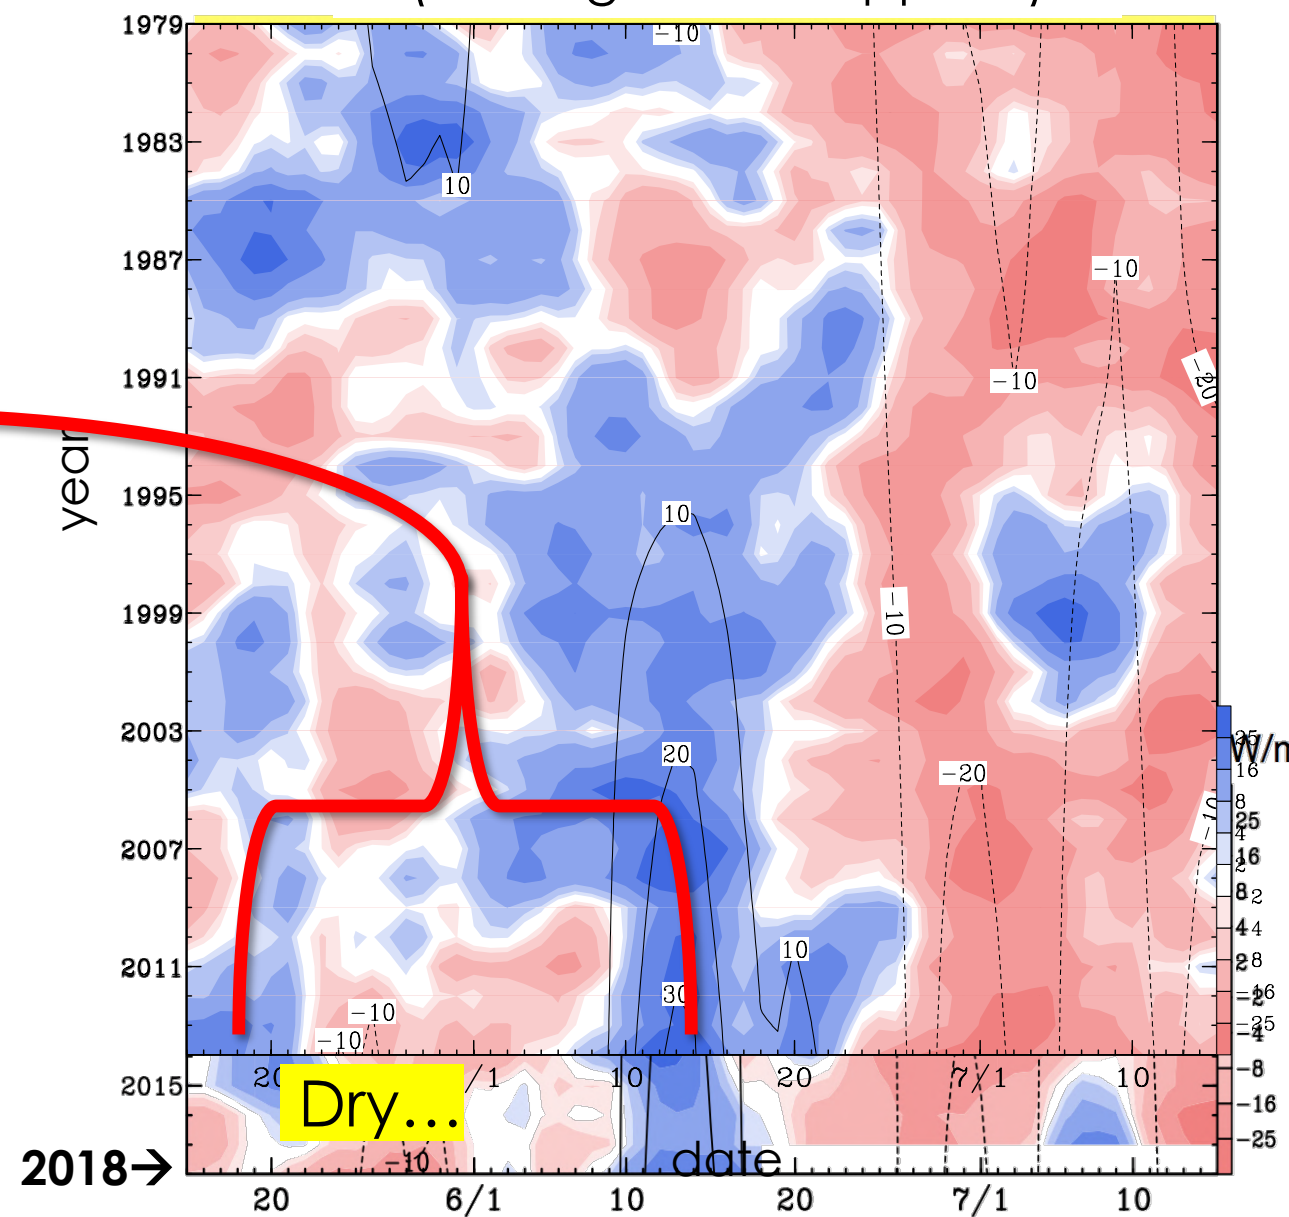

(Wang et al. 2015)

Each year's peak daily  $\Delta\text{OLR}$   
(running means applied)

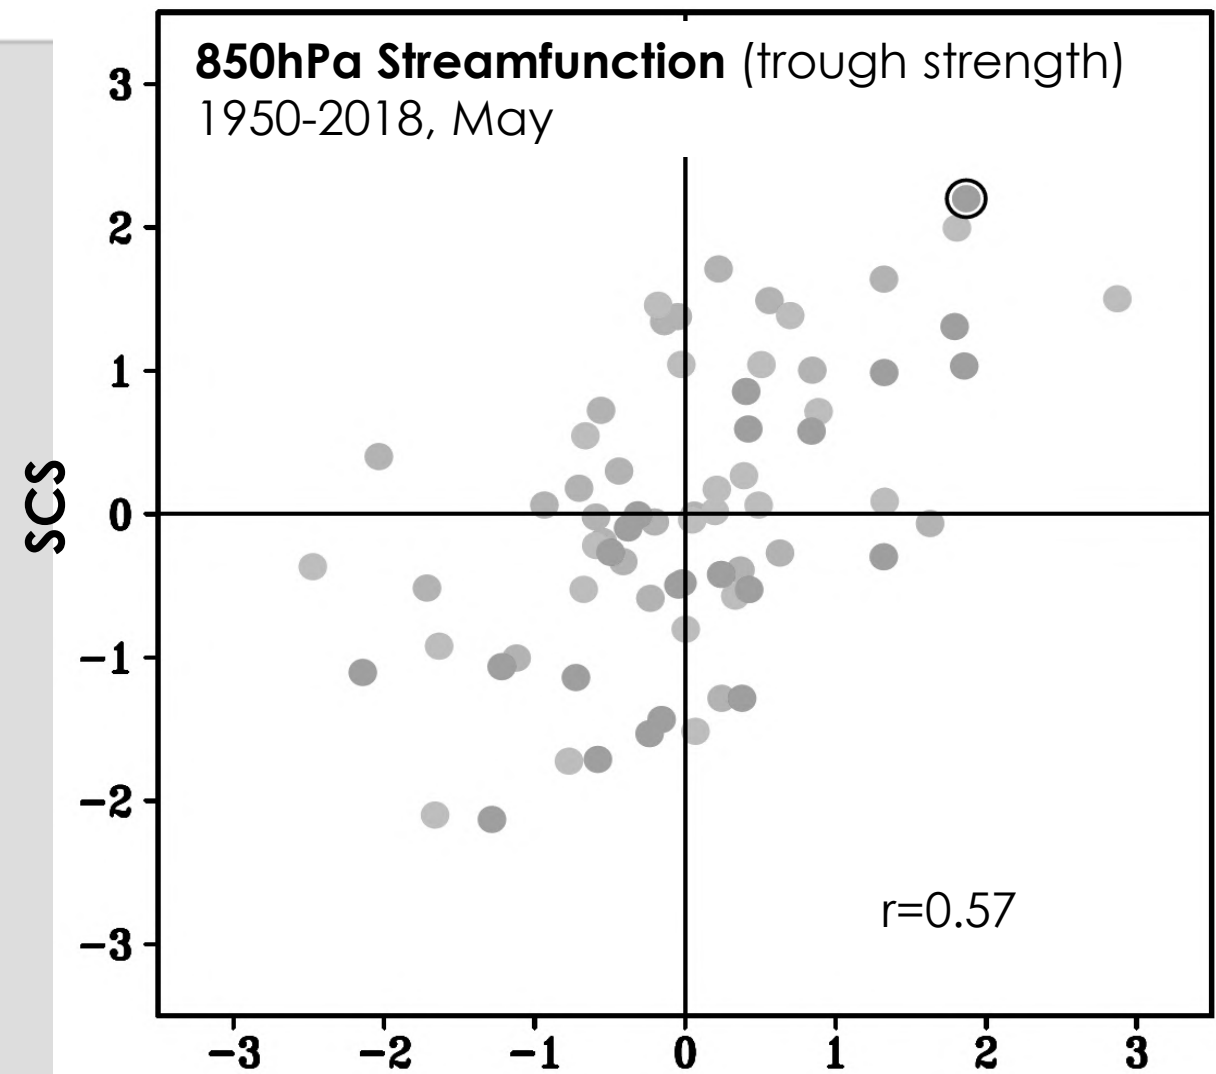

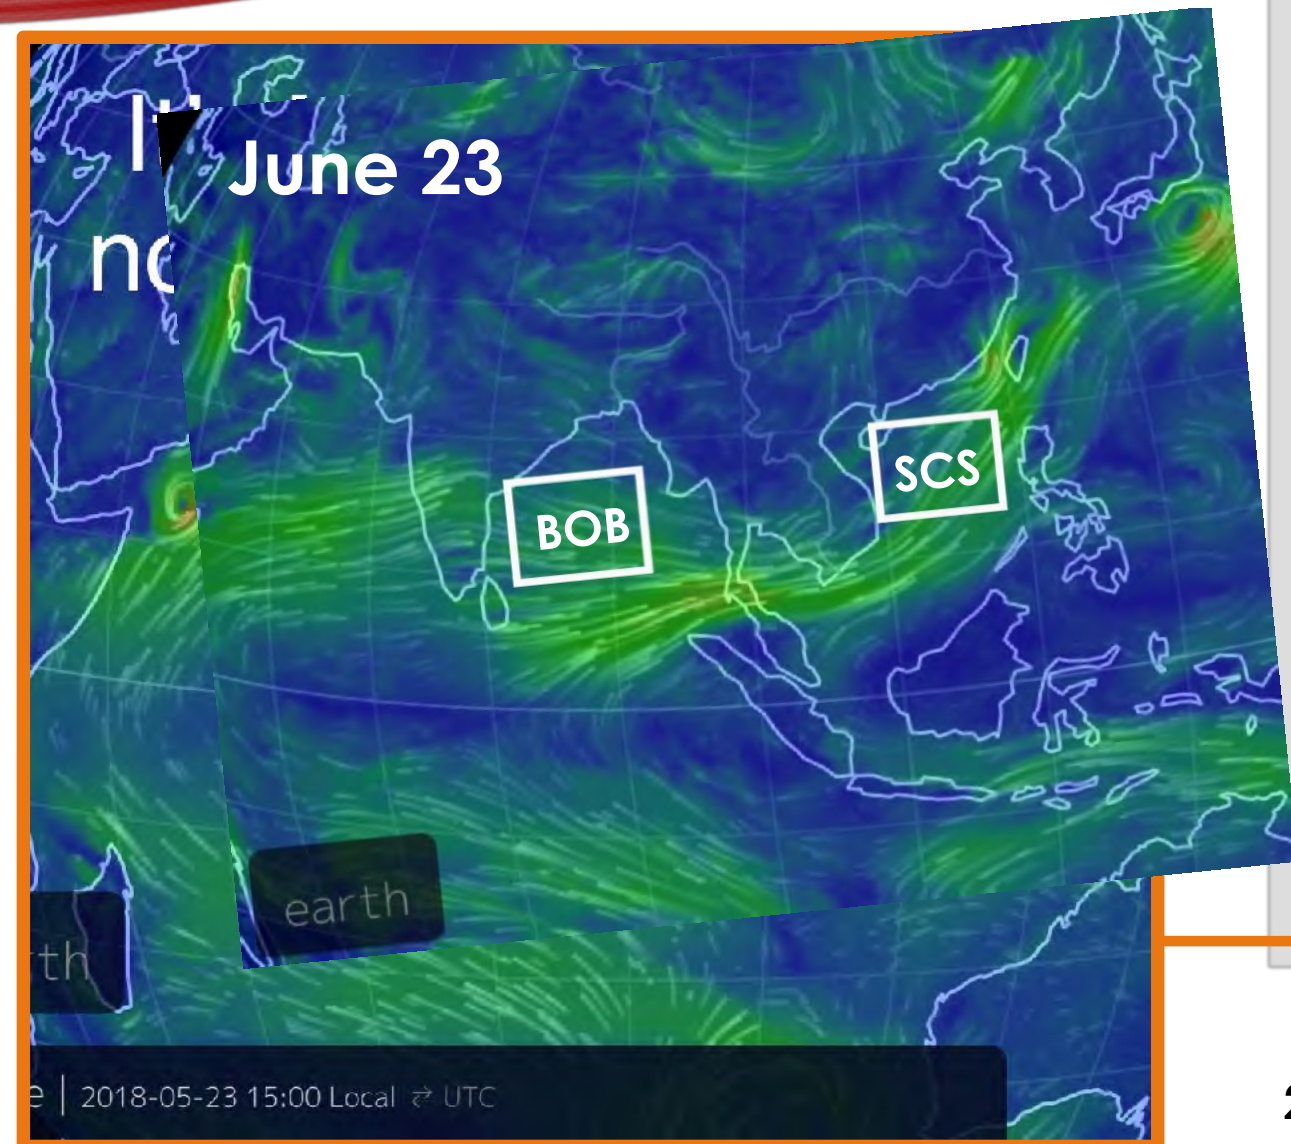

More “subseasonal” ...

Frontal regime  $\rightarrow$  break  $\rightarrow$  Meiyu

(Wang et al. 2015)

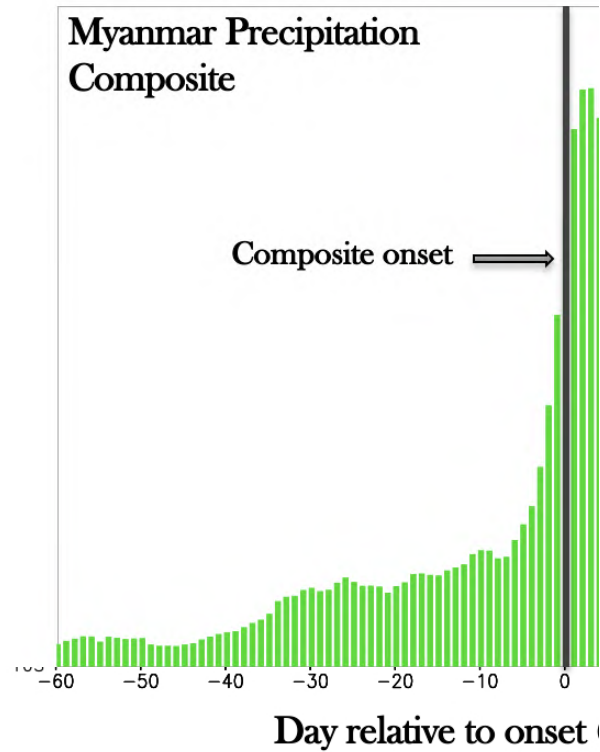

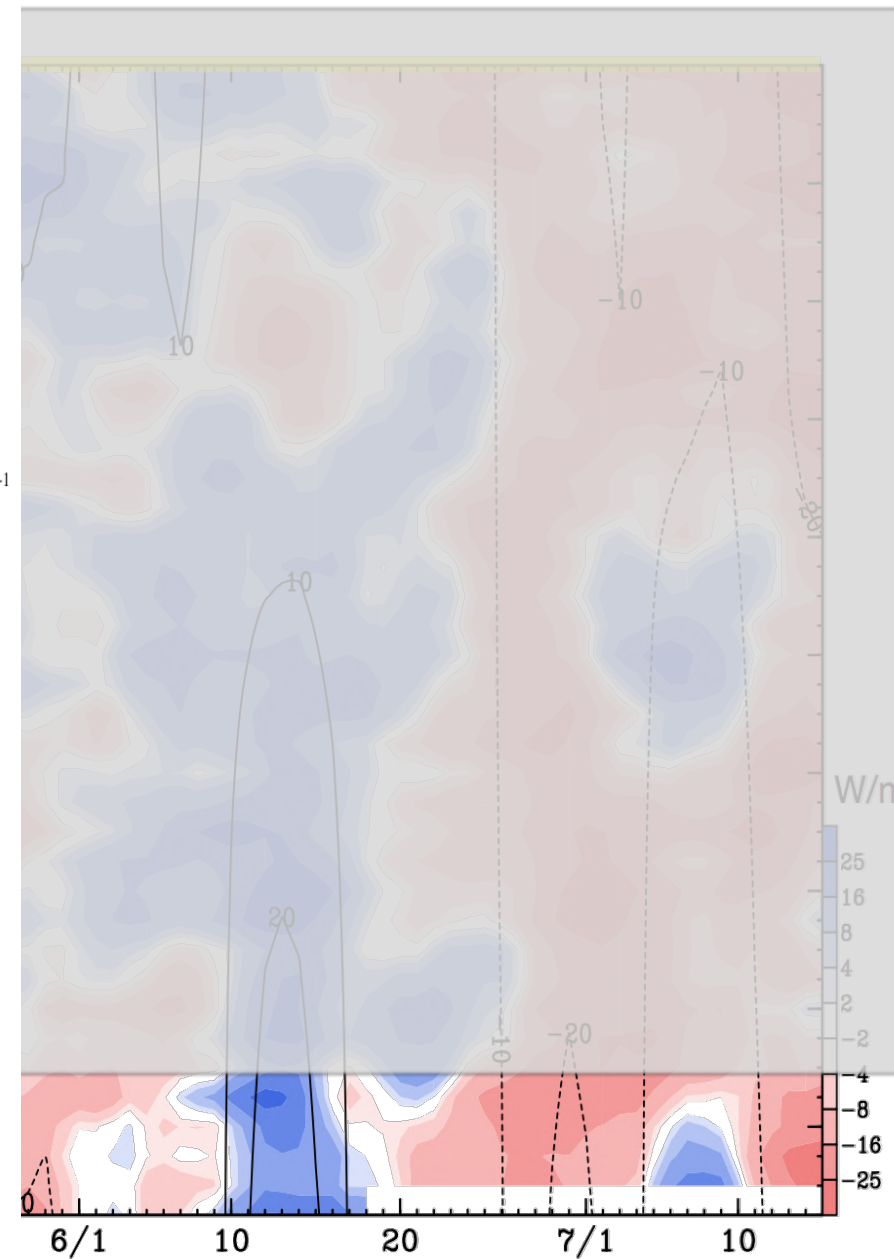

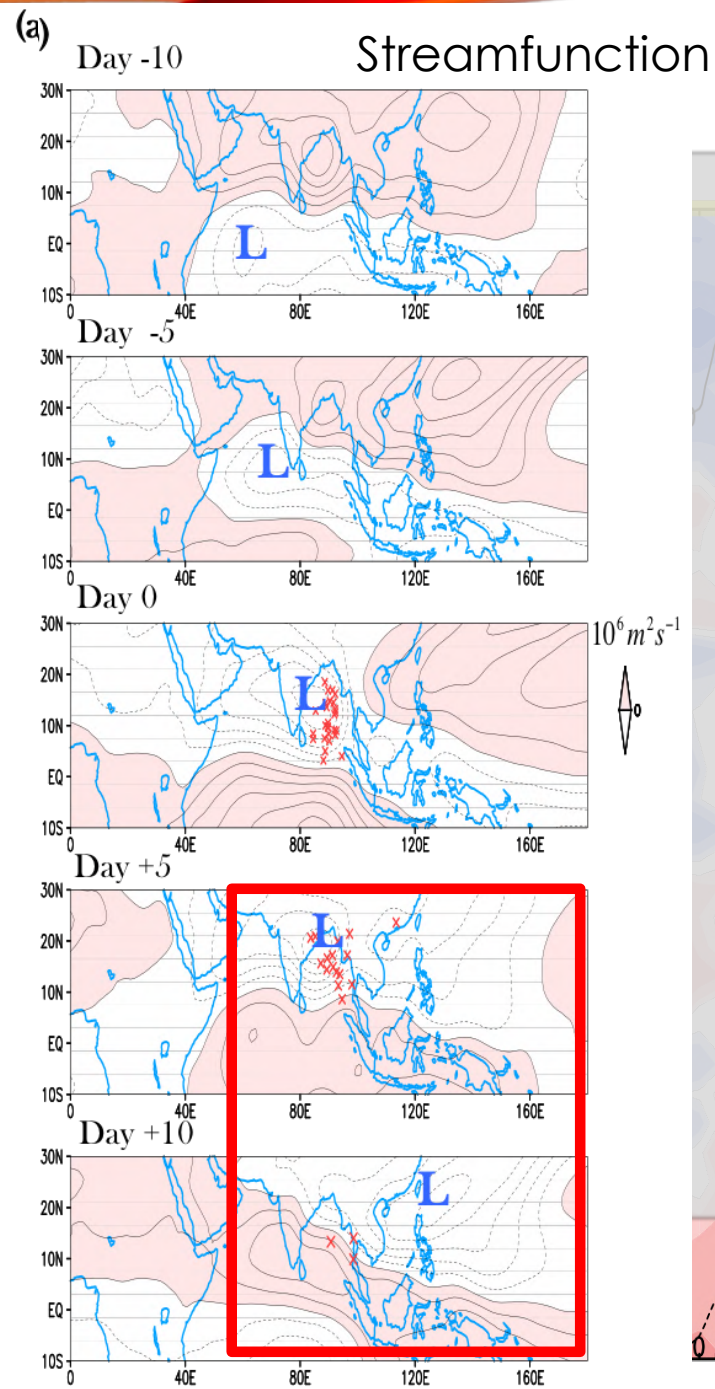

June 23

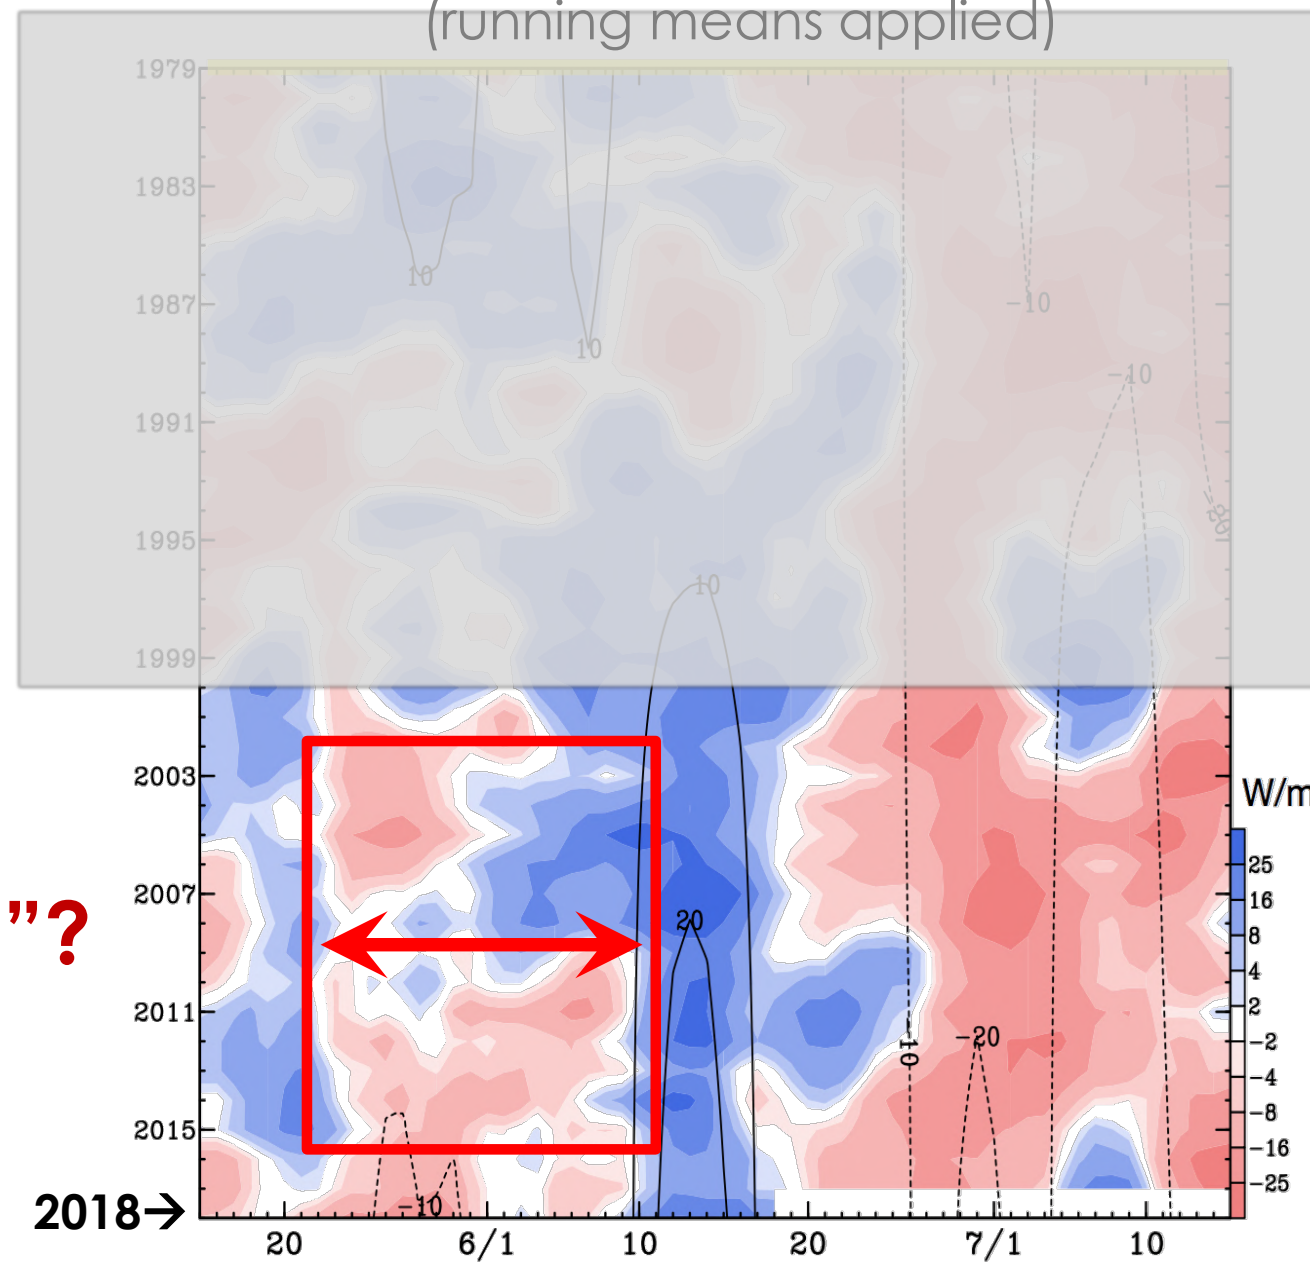

(Fosu and Wang, 2014)

Each year's peak daily  $\Delta\text{OLR}$   
(running means applied)

Cause of subseasonal “gap”?

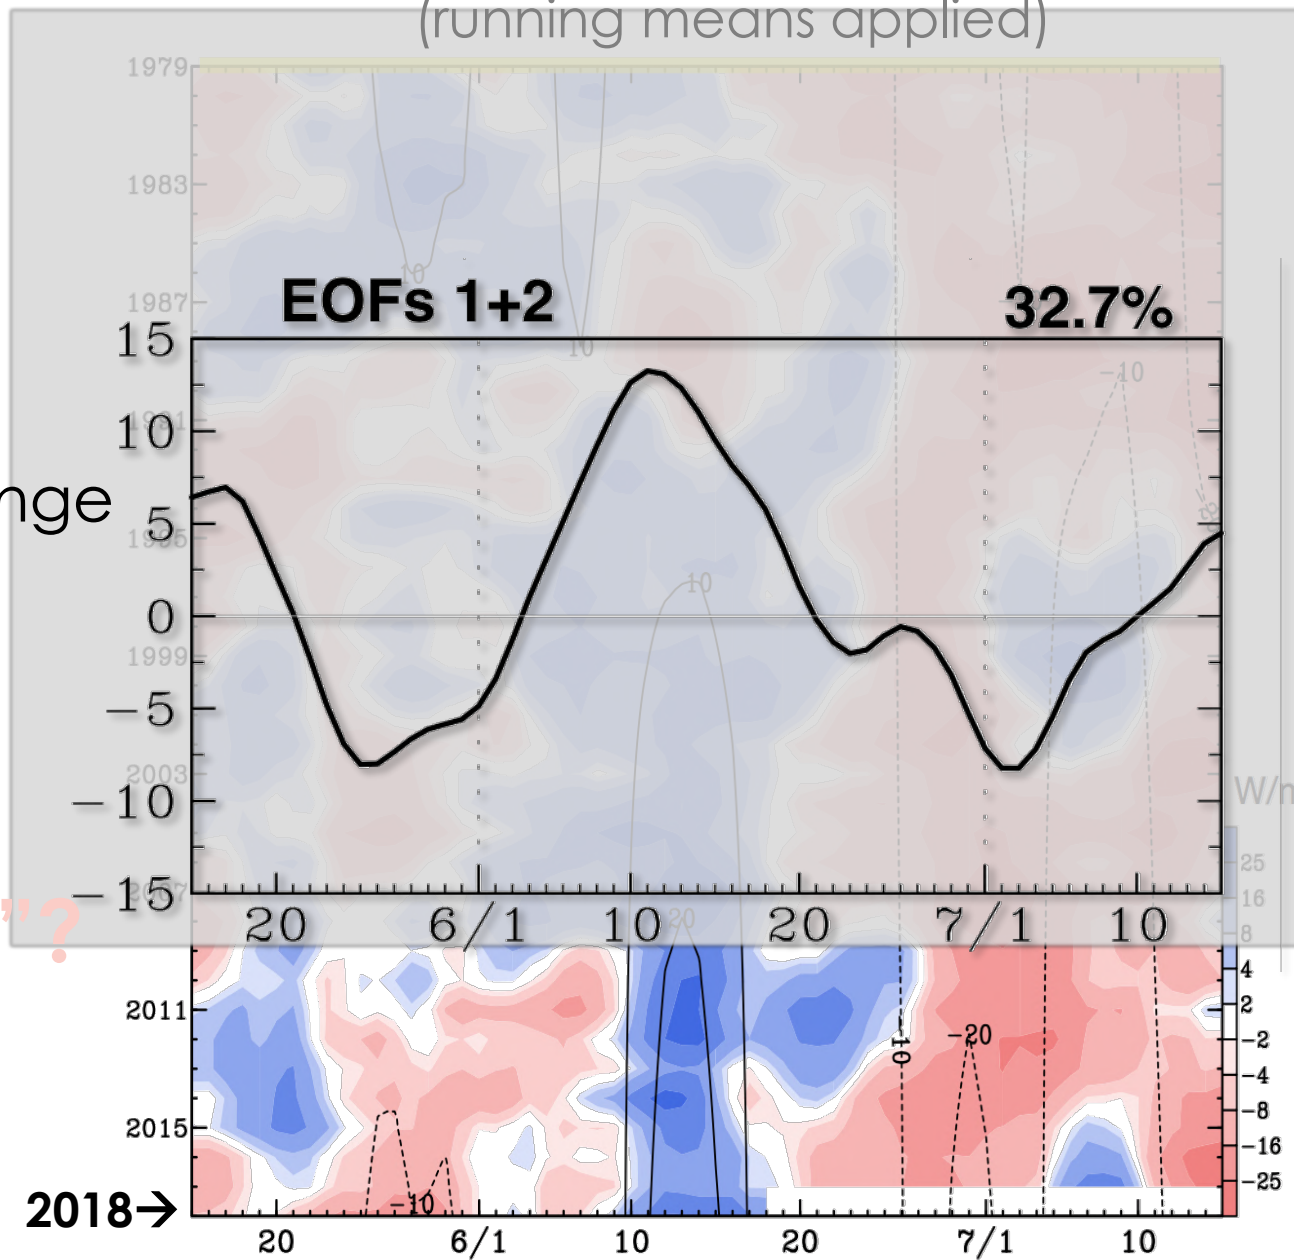

## PCs 1+2

Each year's peak daily  $\Delta OLR$   
(running means applied)

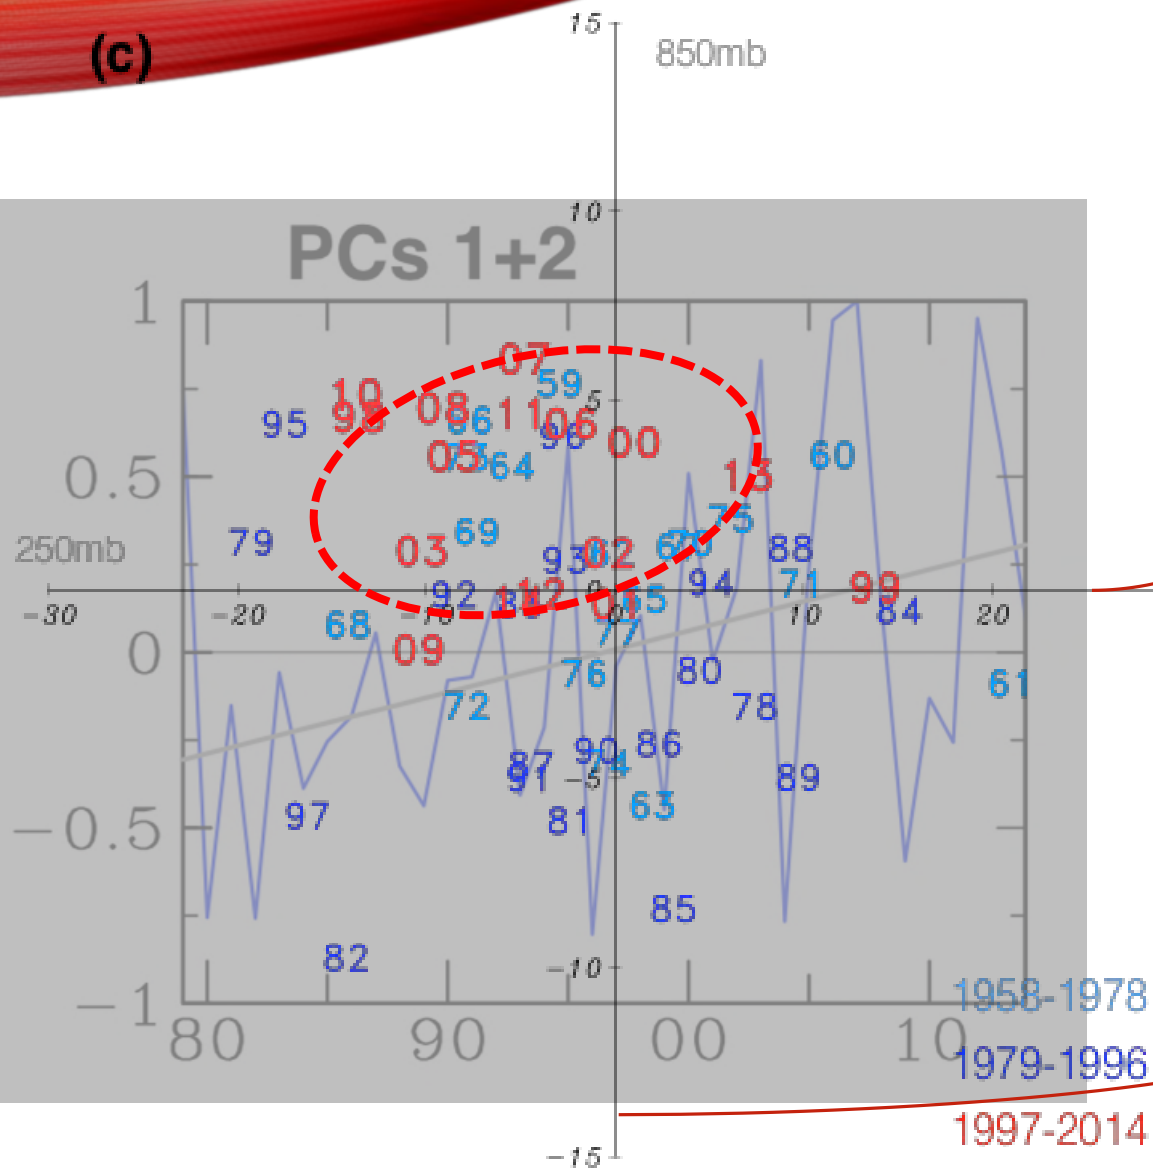

change

lap"?

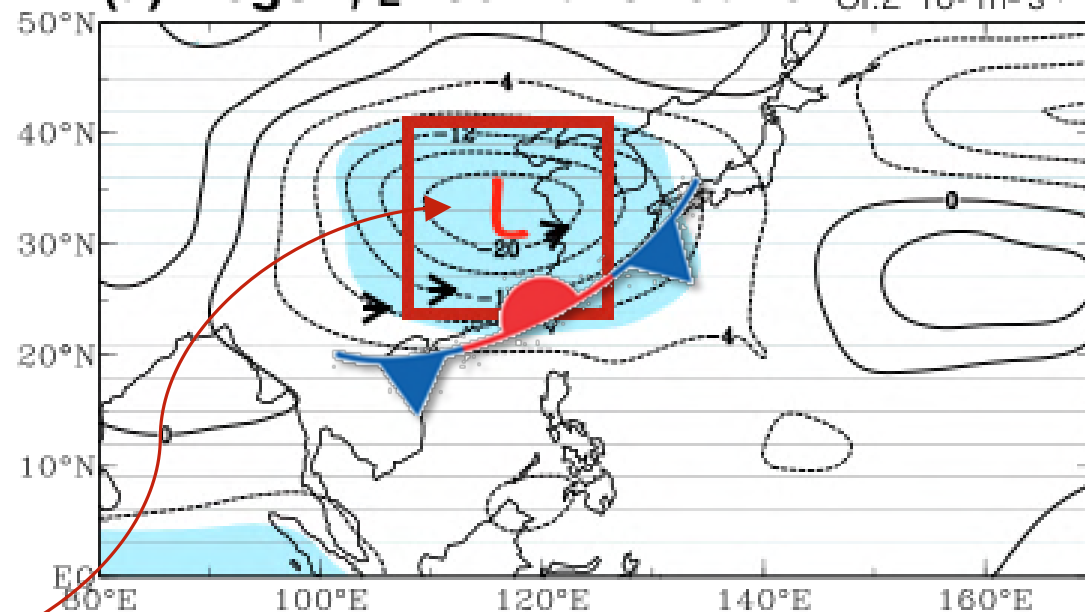

(c)

PCs 1+2

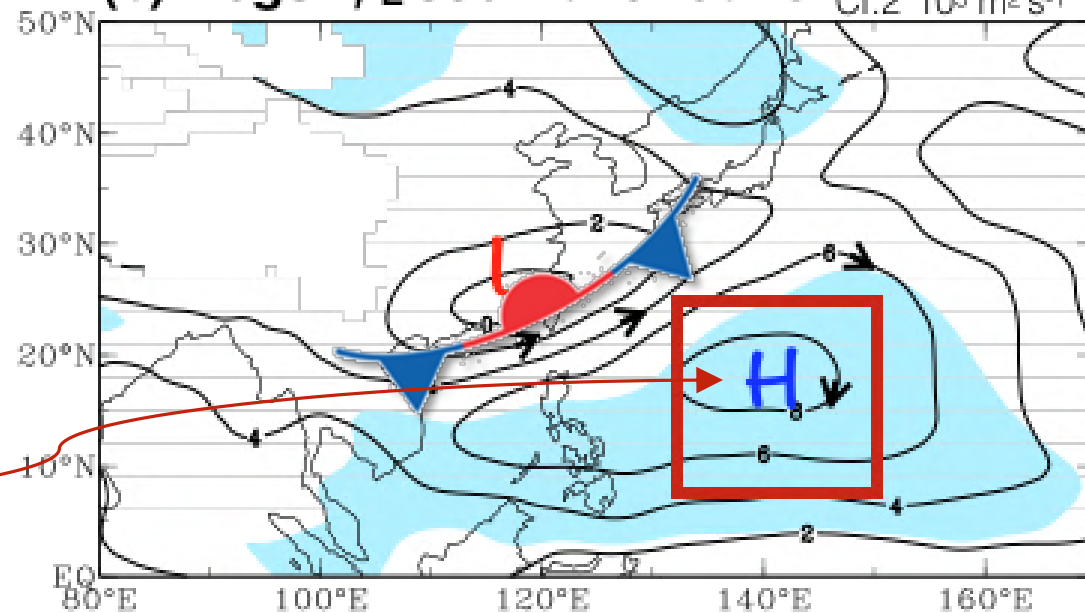

(a) Regs.  $\psi_E$  250mb for June

CI:  $2 \times 10^5 \text{ m}^2 \text{ s}^{-1}$

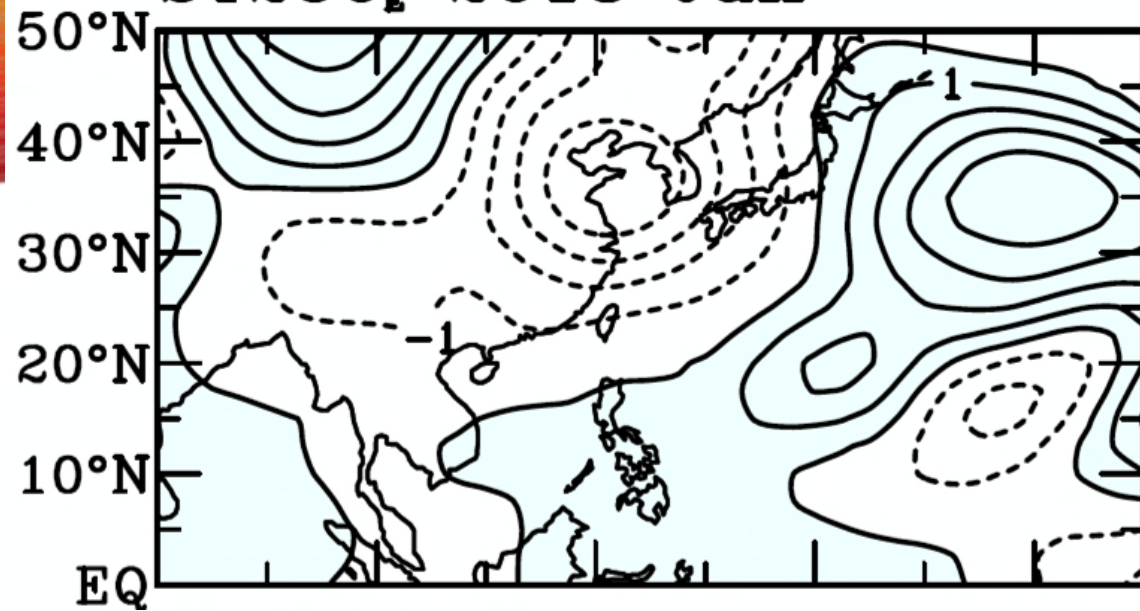

(b) Regs.  $\psi_E$  850mb for June

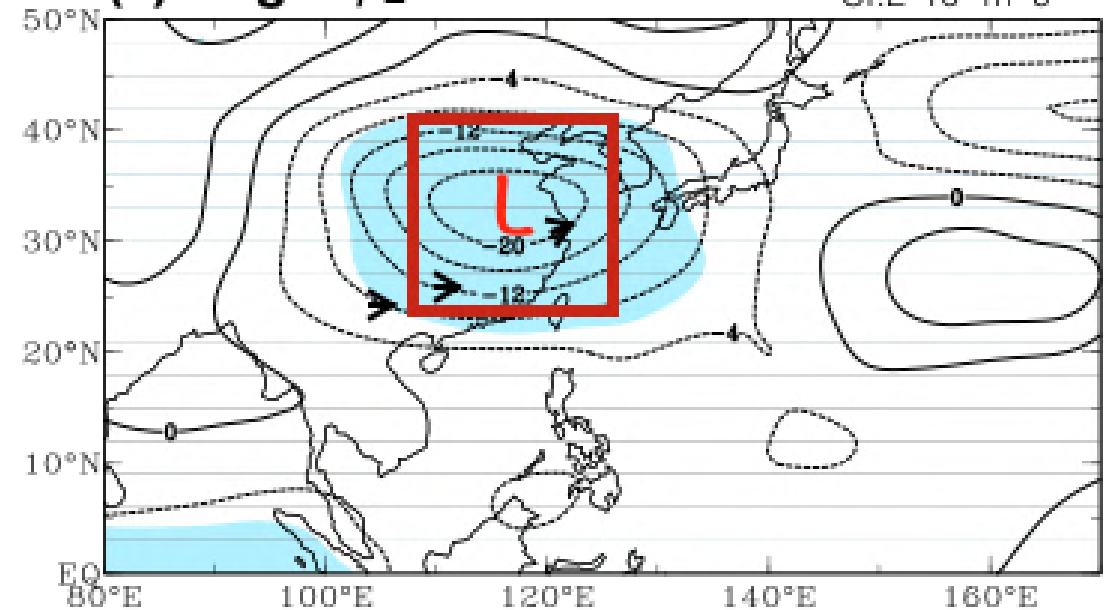

CI:  $2 \times 10^5 \text{ m}^2 \text{ s}^{-1}$

ST250<sub>E</sub> 2018 Jun

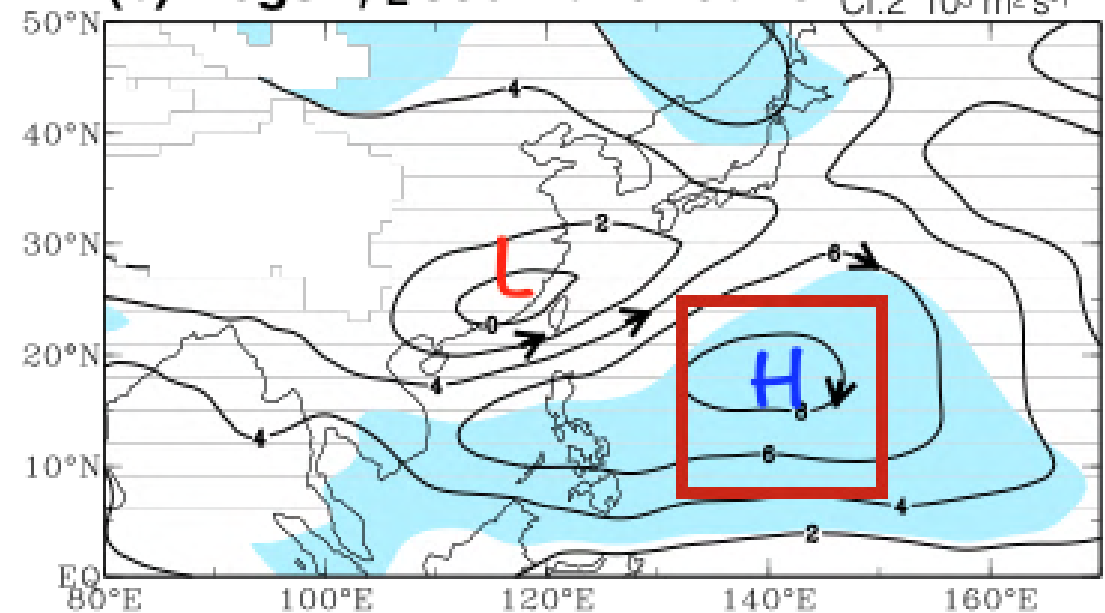

(a) Regs.  $\psi_E$  250mb for June  $Cl: 2 \cdot 10^5 \text{ m}^2 \text{ s}^{-1}$

ST850<sub>E</sub> 2018 Jun

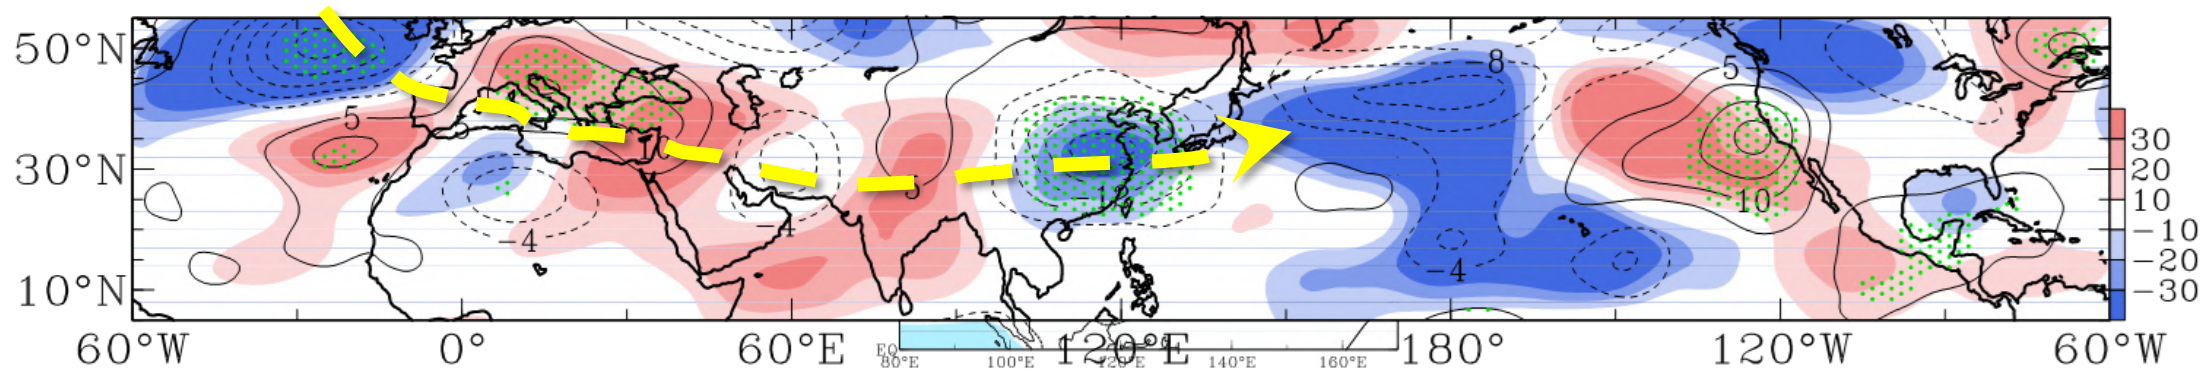

(b) Regs.  $\psi_E$  850mb for June  $Cl: 2 \cdot 10^5 \text{ m}^2 \text{ s}^{-1}$

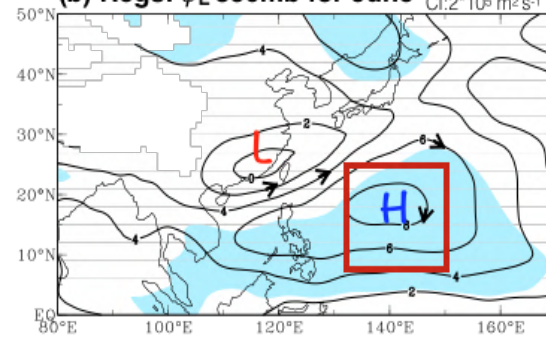

regression pattern of June  $\psi_E$  250 hPa with PC1+2 (contours)  
overlaid with the linear trend slopes of the June  $\psi_E$  (shadings).

(b) Regs.  $\psi_E$  850mb for June

**AA**  $\Rightarrow$  Equatorward shift of polar jet  
vs. poleward shift of  
subtropical jet  
Amplification of quasi-stationary short-wave trains

(a) Regs.  $\psi_E$  250mb for June Cl:  $2 \cdot 10^6 \text{ m}^2 \text{ s}^{-1}$

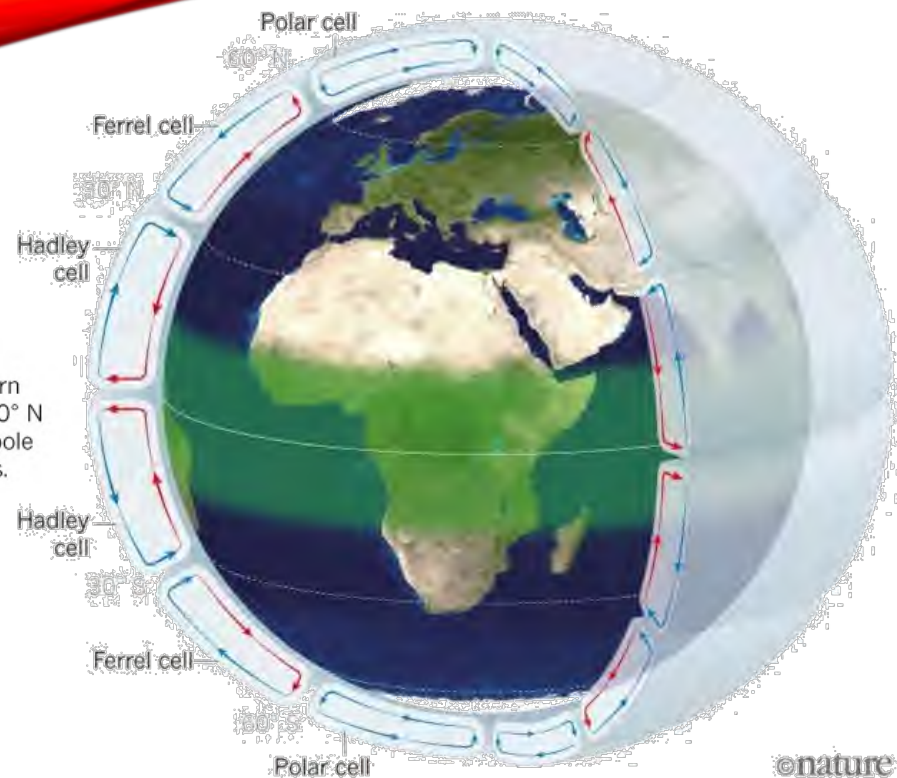

(b) Regs.  $\psi_E$  850mb for June Cl:  $2 \cdot 10^6 \text{ m}^2 \text{ s}^{-1}$

(Coumou et al. 2018)

# BULGING WAISTLINE

Expansion of the tropics can be seen in the Hadley cell, the circulation pattern that carries warm air upwards above the Equator and then down at about 30° N and 30° S. The descending limb of each Hadley cell is shifting towards the pole in both hemispheres, potentially altering climatic conditions in some regions.

strengthened North Pacific subtropical anticyclone in response to increased SST under global warming

(Li et al., 2012; He and Zhou, 2015; Wang et al., 2013)

(a) Regs.  $\psi_E$  250mb for June  $Cl: 2 \cdot 10^5 \text{ m}^2 \text{ s}^{-1}$

(b) Regs.  $\psi_E$  850mb for June  $Cl: 2 \cdot 10^5 \text{ m}^2 \text{ s}^{-1}$

← If these are the future trend,  
then how will Meiyu change?

5-day mean normalized precipitation  
(1981-2000)

Past change:

Sharper, more intense

Change in Taiwan's Meiyu

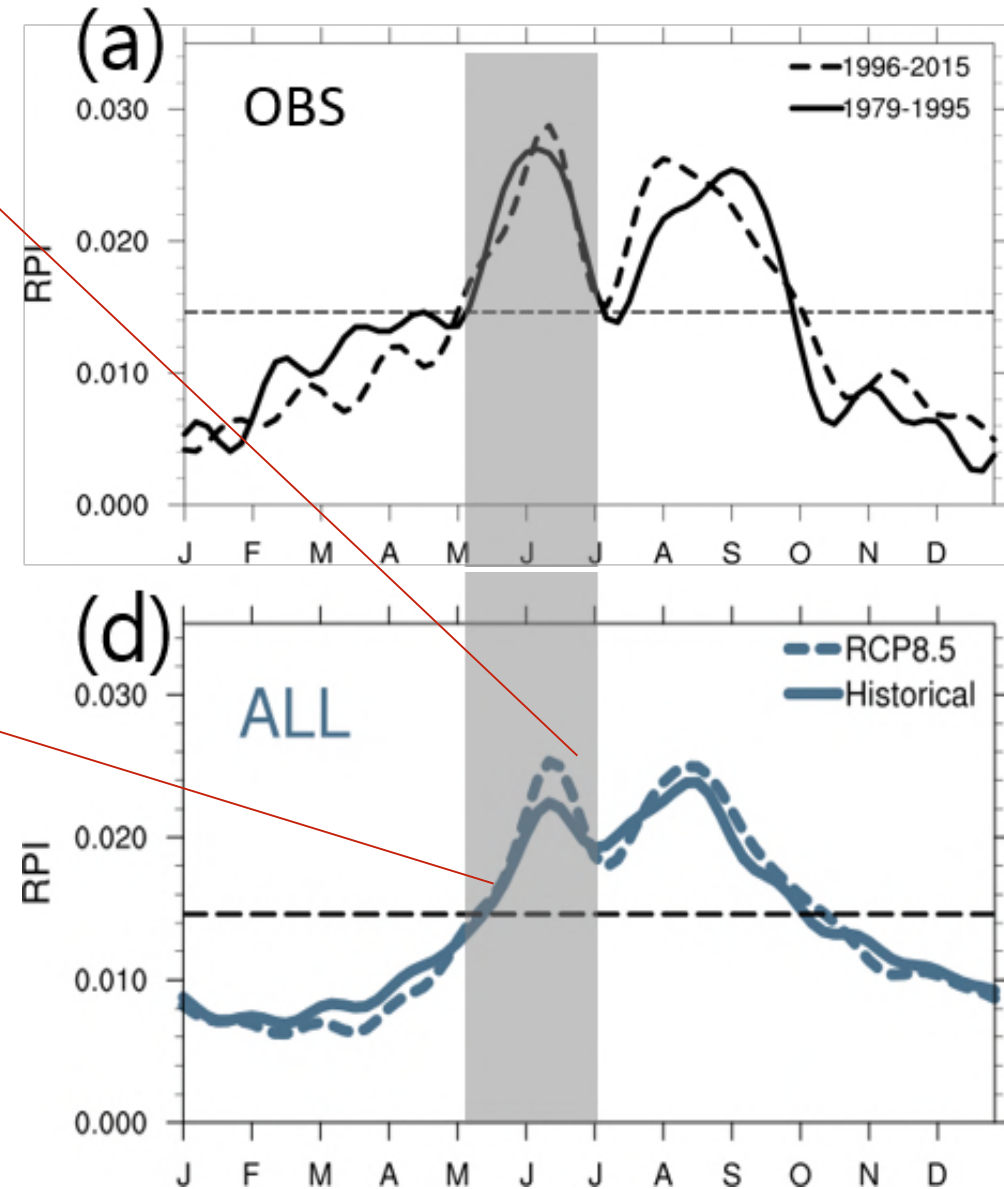

5-day mean normalized precipitation

Projected change:  
from 17 CMIP5 models

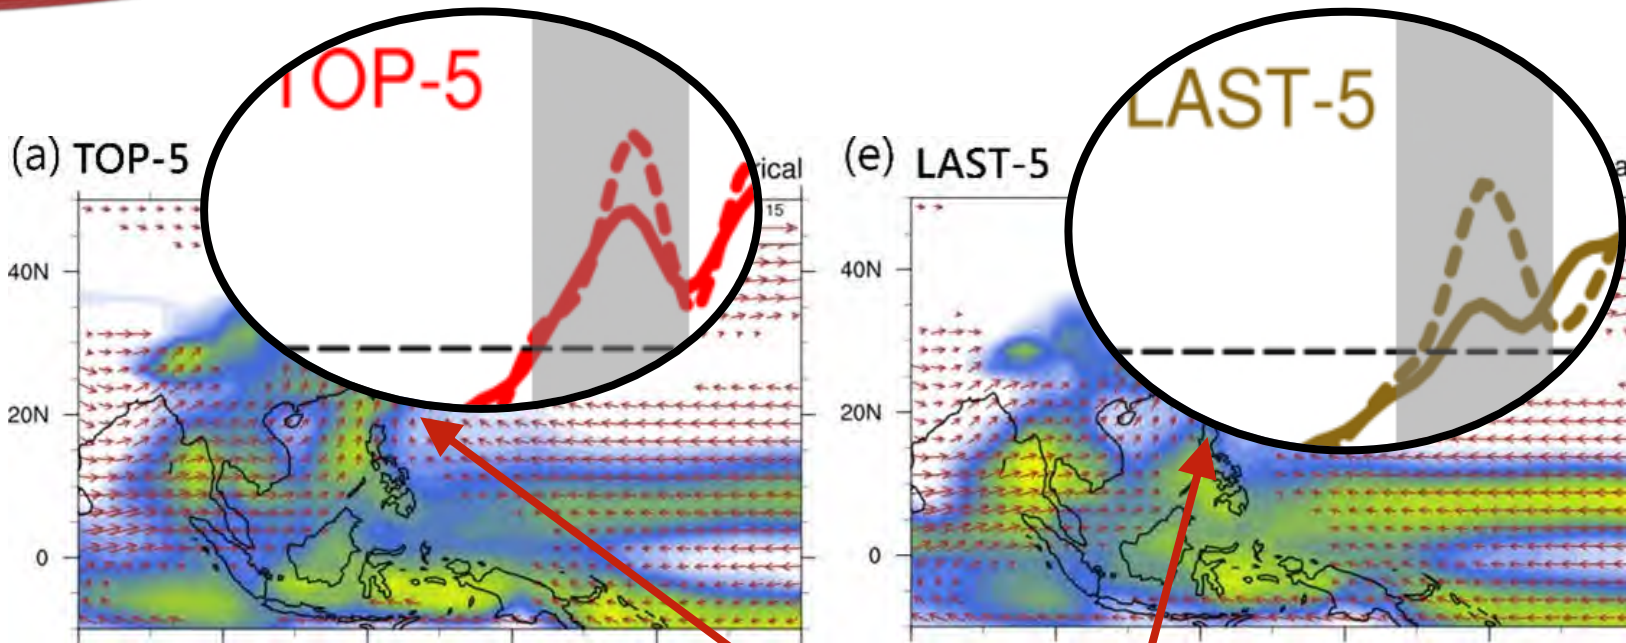

(Tung et al. 2018, in revision)

# Meiyu will increase!

Thermodynamically-  
driven, mostly.

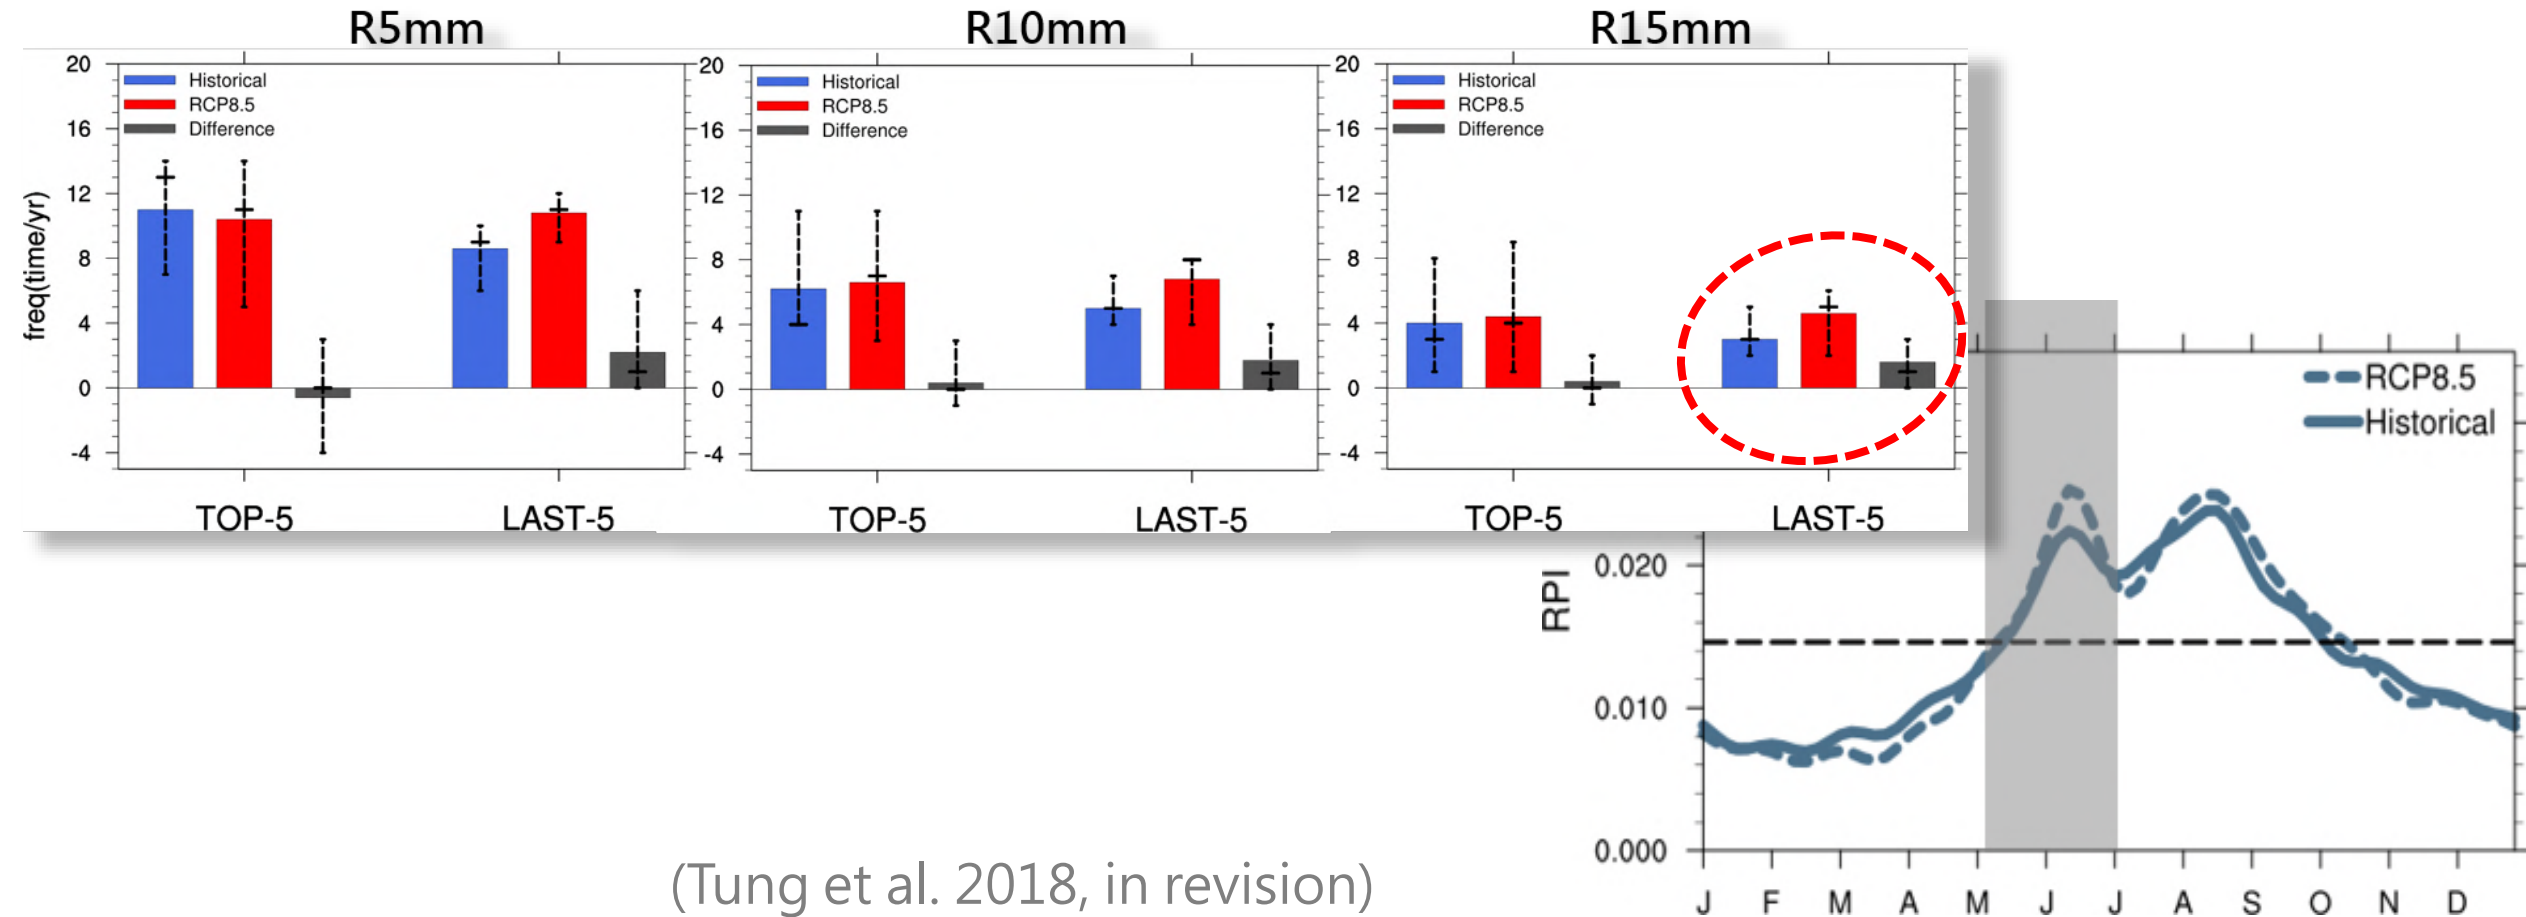

from 17 CMIP5 models

(Tung et al. 2018, in revision)

with a subsequent increase  
in extreme precipitation

(Tung et al. 2018, in revision)

Has it already?

3-hr extreme of 95% percentile

extreme precipitation occurrence

(Wu et al. 2018, in revision)

extreme precipitation occurrence

(Wu et al. 2018, in revision)

恐17年來最晚梅雨！氣象局憂「空梅」、水利會長失眠

"pre-Meiyu drought"

Late onset

Late onset

$$r_s = 0.88$$

CFSv2 reforecast  
of BoB monsoon  
trough:  
week-2 for May

Linking the two:

Applying the relatively stable prediction skill of the Bay of Bengal monsoon onset for the prediction of SCS monsoon onset and improve long-range forecast for the Meiyu.
