interpretation**

**Recognition
of the value**

**Actionable
information**

**Illegible BSISO index
→ user friendly information**

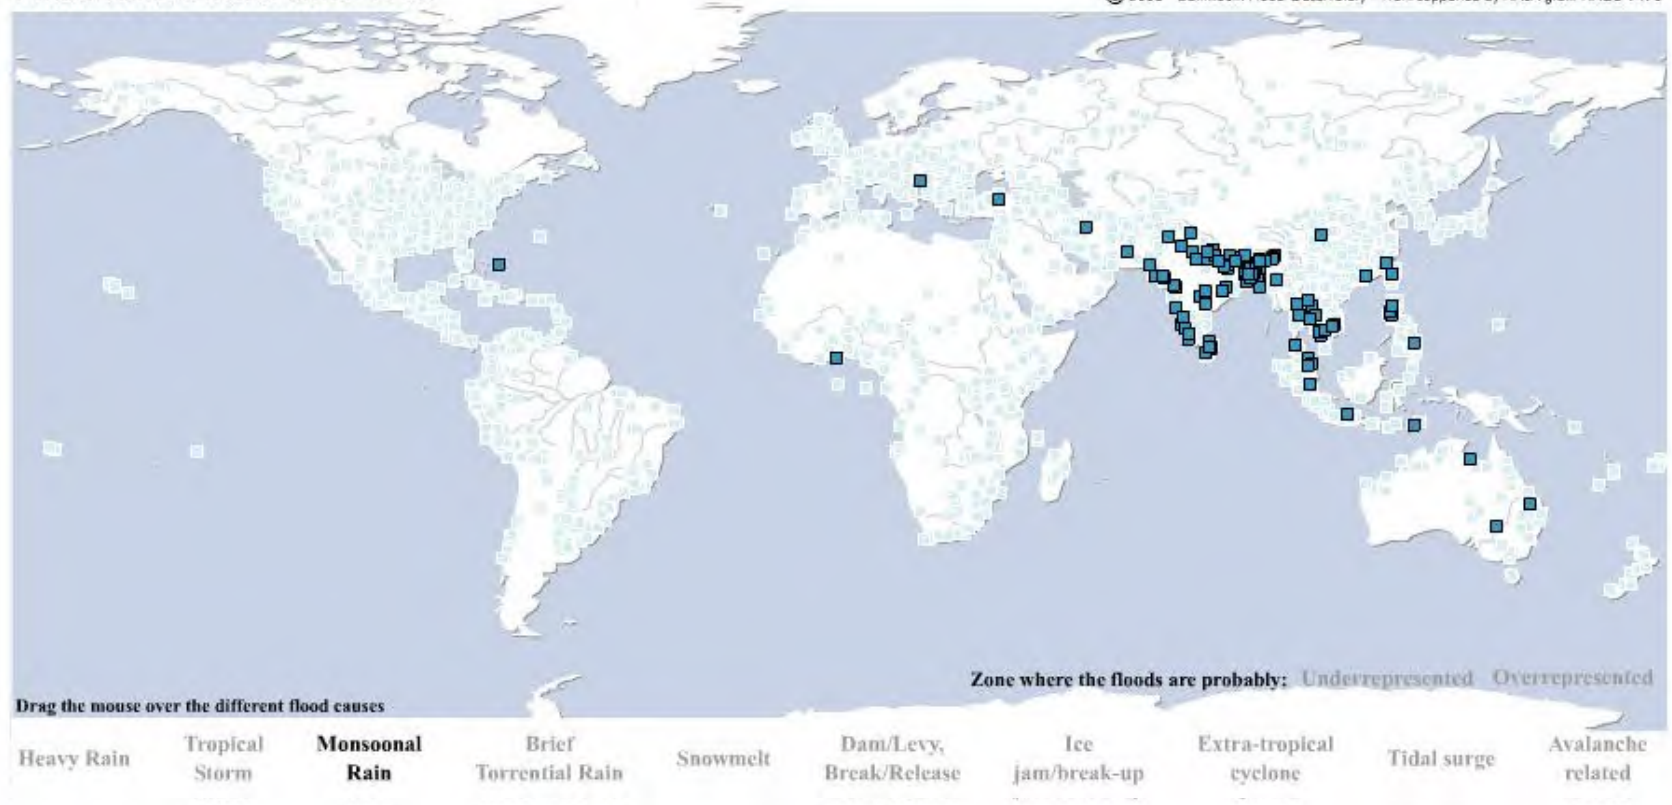

Better forecast? *practical use*

What is the actionable information for?

Flood causes listed since 1985

© 2003 - Dartmouth Flood Observatory - Work supported by NASA grant NAG5-9470

A lot of ***flooding*** is caused by heavy rain, tropical storm and monsoonal rain .

Better forecast? *practical use*

What is the actionable information for?

When do the floods start?

Those could be *considerably associated with the BSISO activity.*

Better forecast? *practical use*

Under operational perspective

#1. To find the BSISO impact on heavy rainfall

#2. To make a user guideline for somewhere or somebody

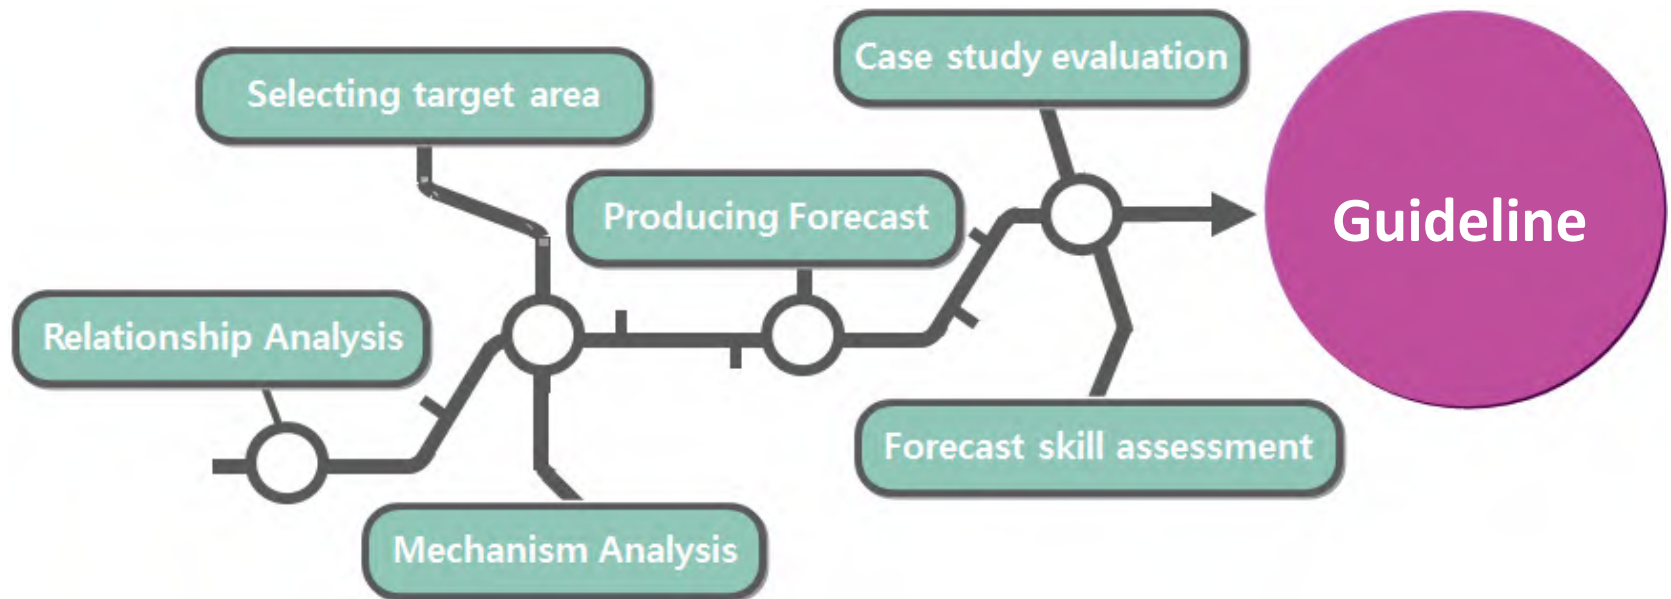

: Focused on the *flood prone areas with large rivers over Southeast Asia*

Better forecast? *practical use*

Strategy

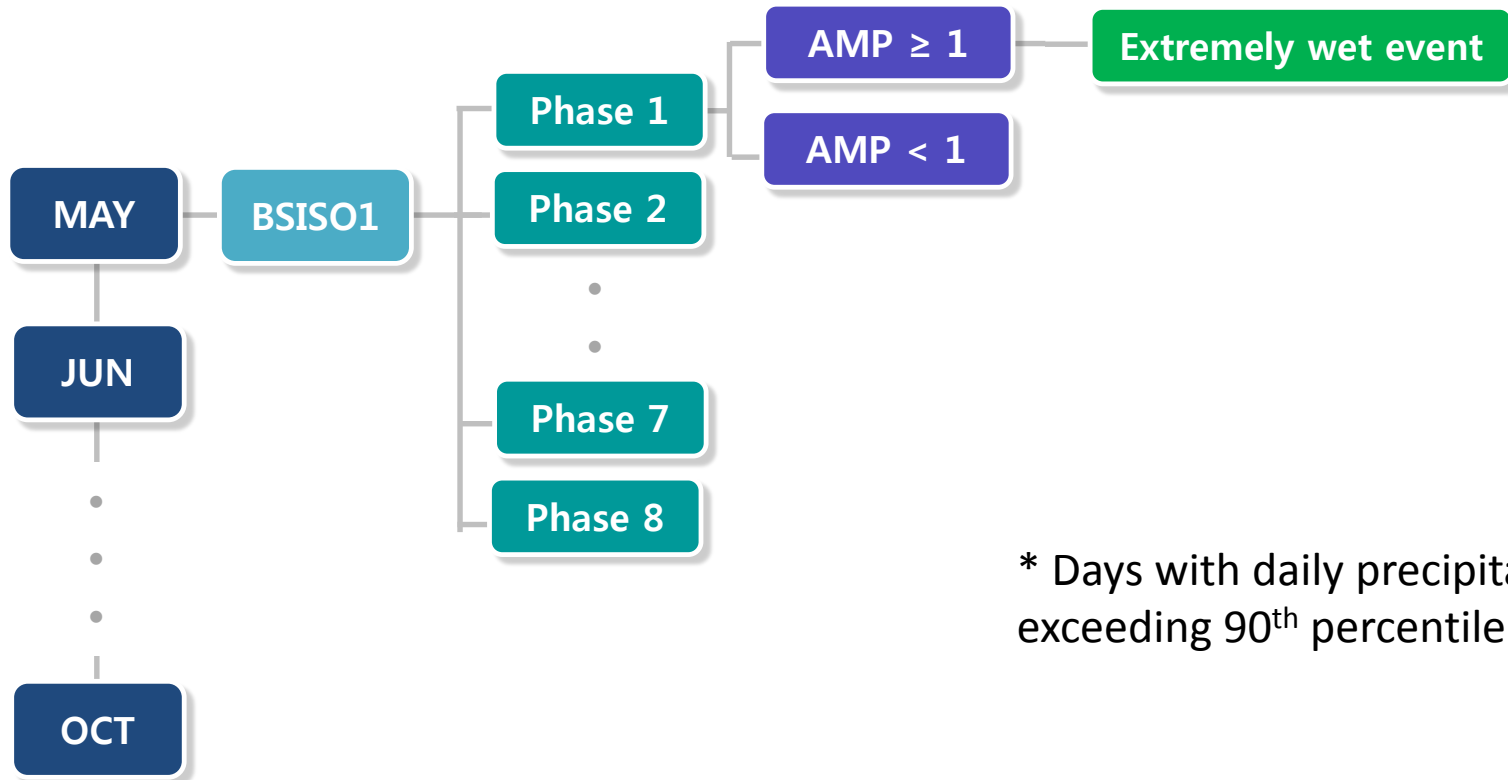

'15 '16

Better forecast? *practical use*

Relationship analysis (*Composite analysis : BSISO-Heavy rainfall probability*)

* Days with daily precipitation exceeding 90th percentile

Probability of heavy rainfall occurrence estimated by BSISO phases & amplitude

$$= \frac{\text{number of days [BSISO1}_{\text{AMP}} \geq 1, \text{ BSISO1 phase1, daily PRCP} > 90\text{th percentile}]}{\text{number of days [BSISO1}_{\text{AMP}} \geq 1, \text{ BSISO1 phase1}]} \times 100$$

Better forecast? *practical use*

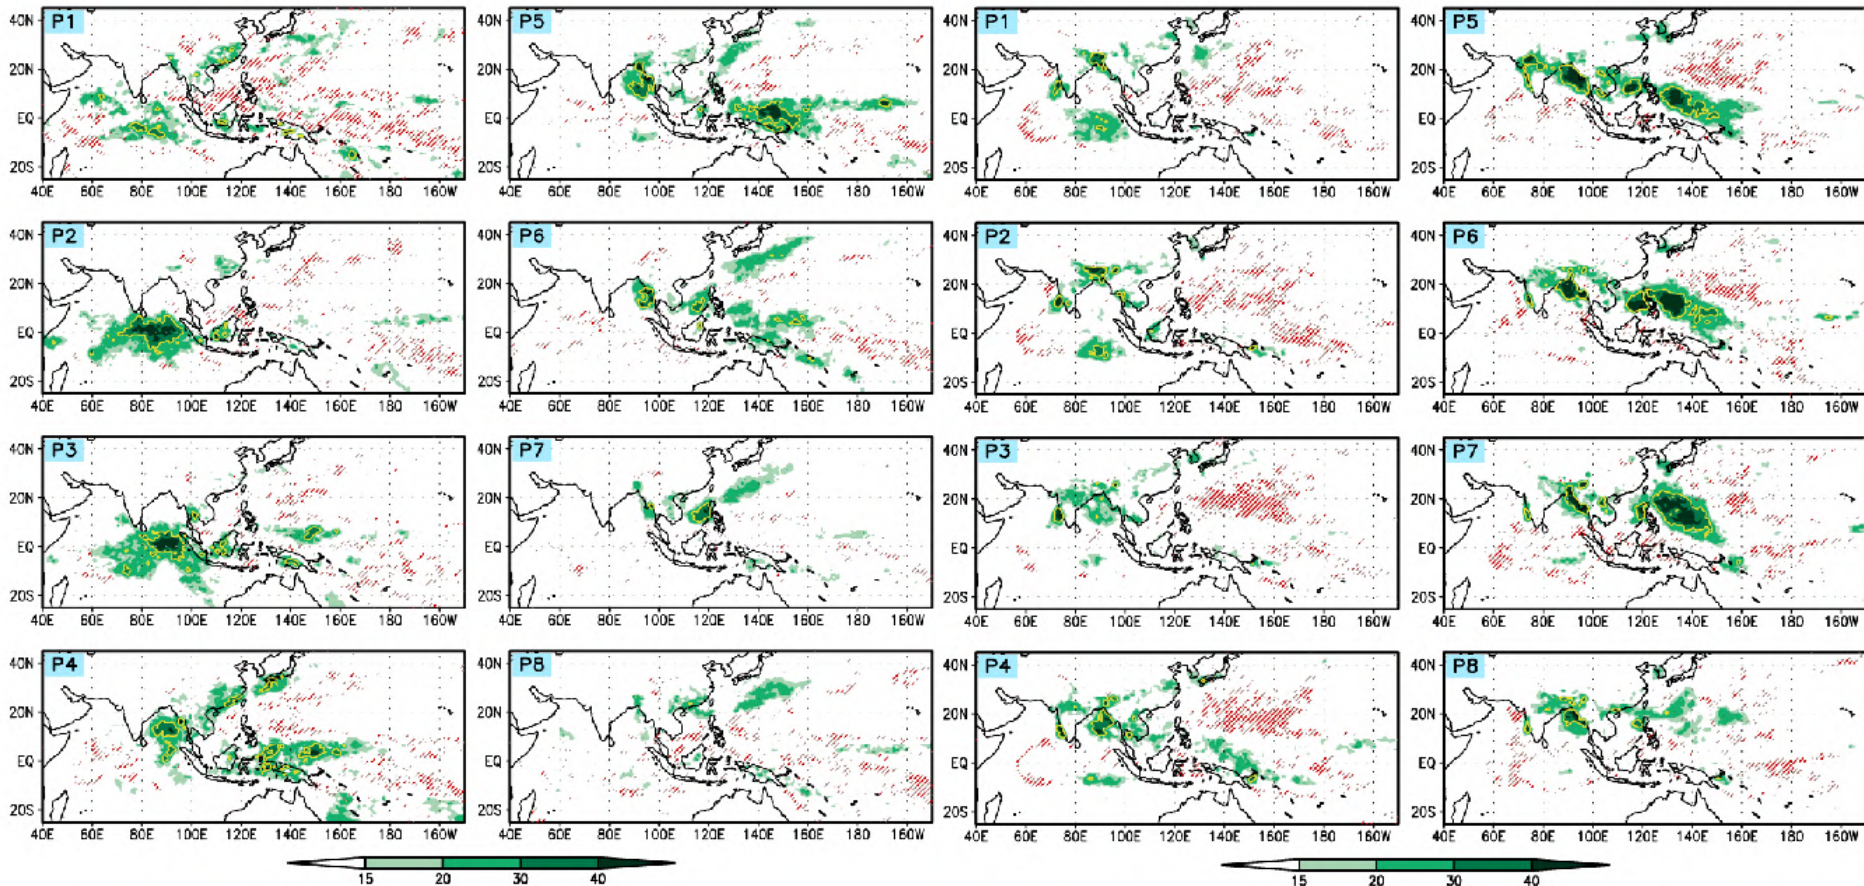

Relationship analysis (Composite analysis : BSISO-Heavy rainfall probability)

Probability of extreme rainfall occurrence based on BSISO phases

[e.g.MAY, BSISO1 \geq 1.0]

[e.g.JUL, BSISO2 \geq 1.0]

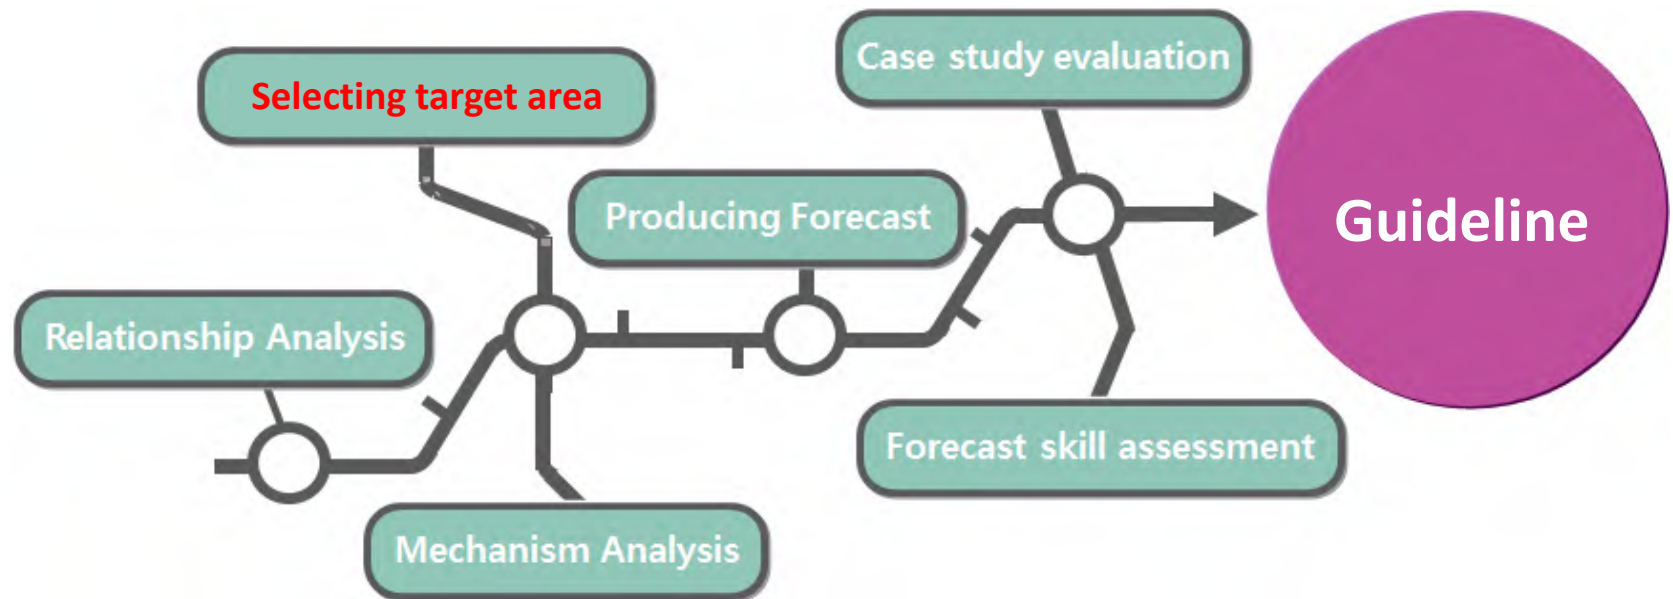

Better forecast? *practical use*

Strategy

'15 '16

Better forecast? *practical use*

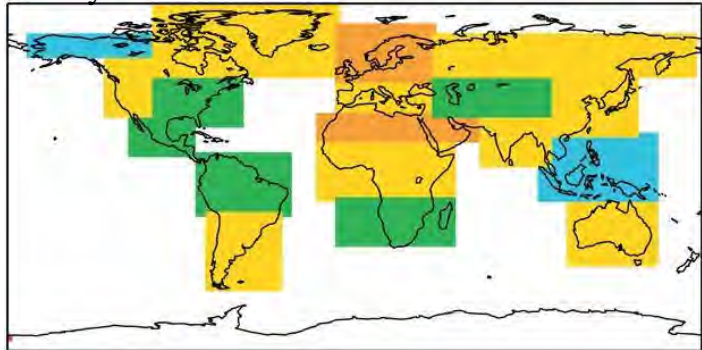

Selecting target area

#R1. Developing countries in the APEC region

#R2. Predictable region from the view of meteorologist

Reliability categorization of precipitation forecasts

(a) Dry DJF

(b) Wet DJF

(c) Dry JJA

(d) Wet JJA

5 perfect 4 still useful 3 marginally useful 2 not useful 1 dangerous

The precipitation forecast over *Southeast Asia* is useful.

It is consistent among the events and seasons.

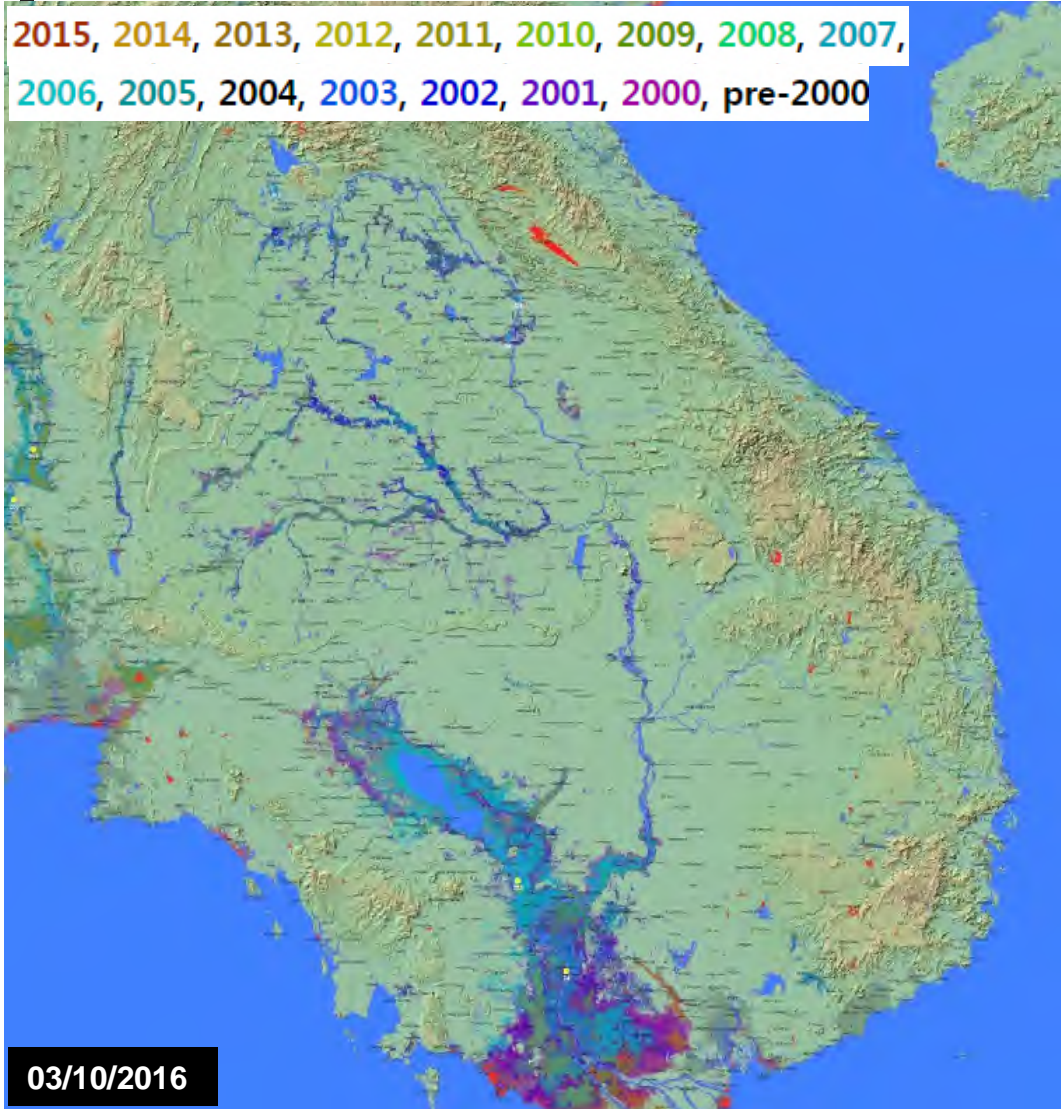

A. Weisheimer, and T. N. Palmer, J. R. Soc. Interface 2014;11:20131162

Better forecast? *practical use*

Selecting target area

Strategy

'15 '16

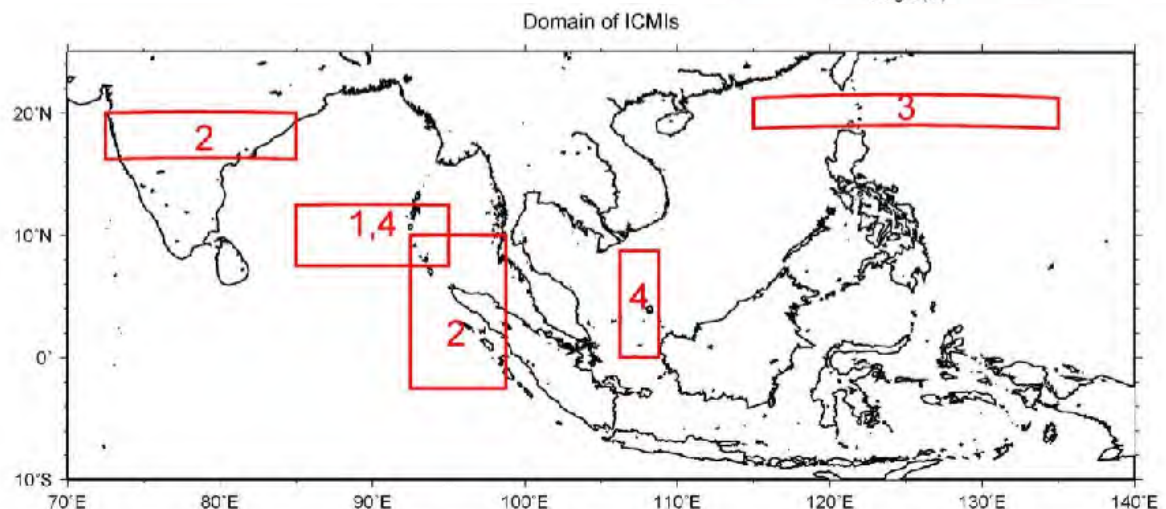

Better forecast? *practical use*

Mechanism Analysis (*BSISO-Extreme rainfall probability*)

Because the precipitation in Thailand is *influenced by local monsoon winds* rather than Indian monsoon or WNP monsoon, a new set of indices incorporating these winds was explored and these four indices are named the *Indo-China Monsoon Indices (ICMIs)*. These ICMIs *better explain the rainfall* over Thailand monsoon domain.

Tsai, C., Behera, S.K. & Waseda, T. (2015).
Indo-China Monsoon Indices. Sci. Rep. 5,
8107; DOI:10.1038/srep08107

Figure 8 | Domain of ICMIs. The boxes represent the domains of ICMIs and the numbers represent the type of ICMIs.

Better forecast? *practical use*

Mechanism Analysis (*BSISO-Extreme rainfall probability*)

[MAM] TMD are influenced by the developing phase of the Southeastern Asian Summer Monsoon. This monsoon early signal can be detected ***from the changing zonal wind east of Sri Lanka.***

[JJA] The strengthening of ***the easterlies east of Hainan Island*** brings extra precipitation to TMD.

[SON] Normal/slow decaying Southeastern Asian Summer Monsoon and ***southerlies in south of Vietnam*** are necessary to bring extra precipitation to TMD.

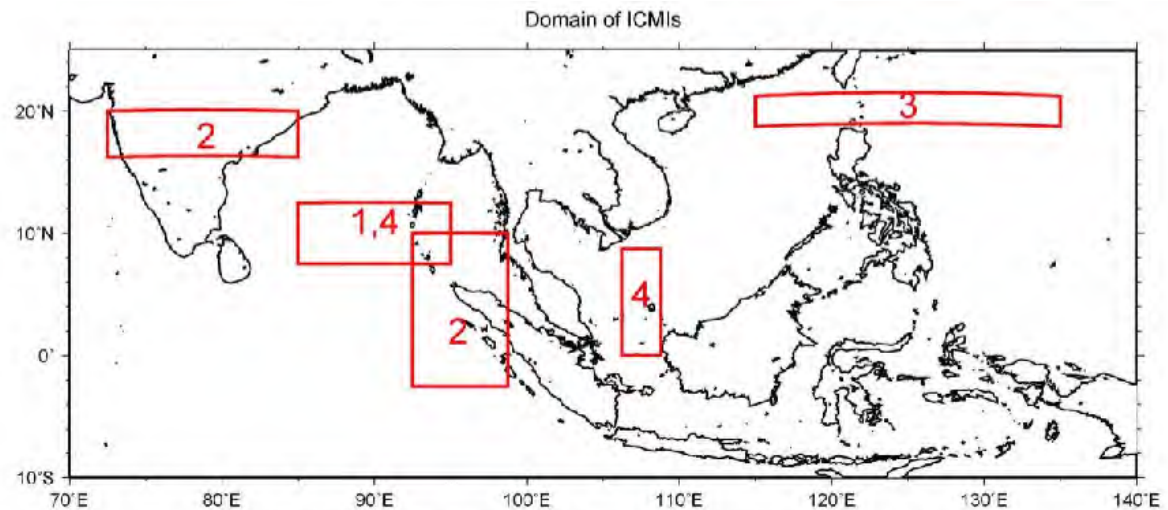

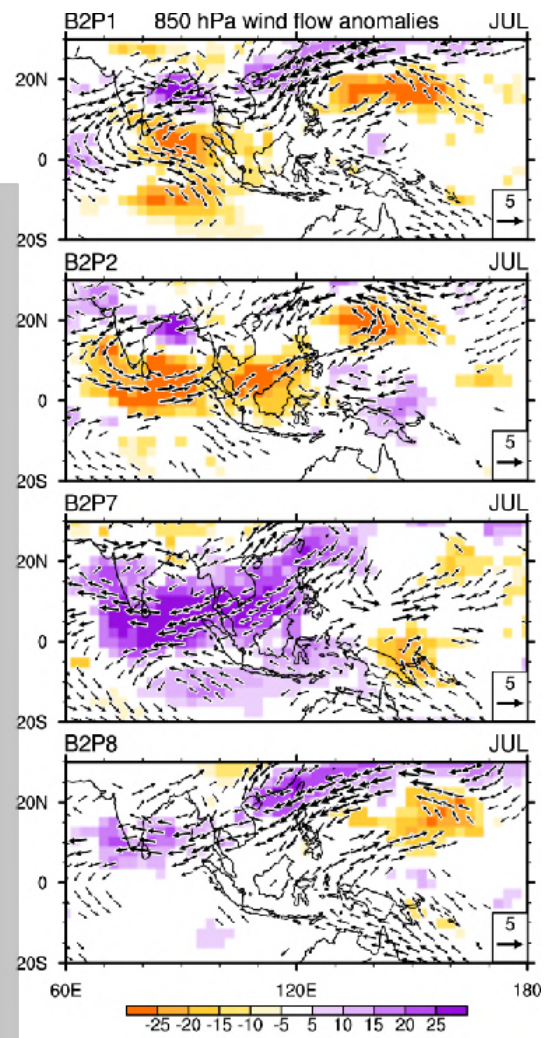

Figure 8 | Domain of ICMIs. The boxes represent the domains of ICMIs and the numbers represent the type of ICMIs.

Mechanism Analysis (BSISO-Extreme rainfall probability)

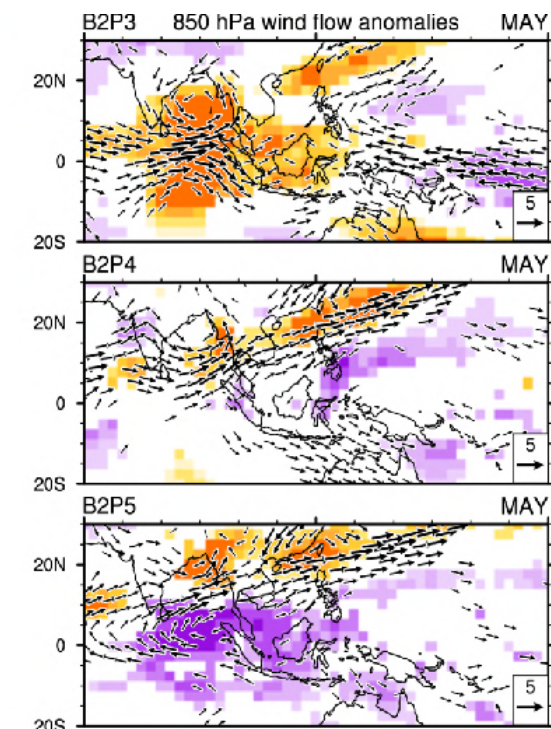

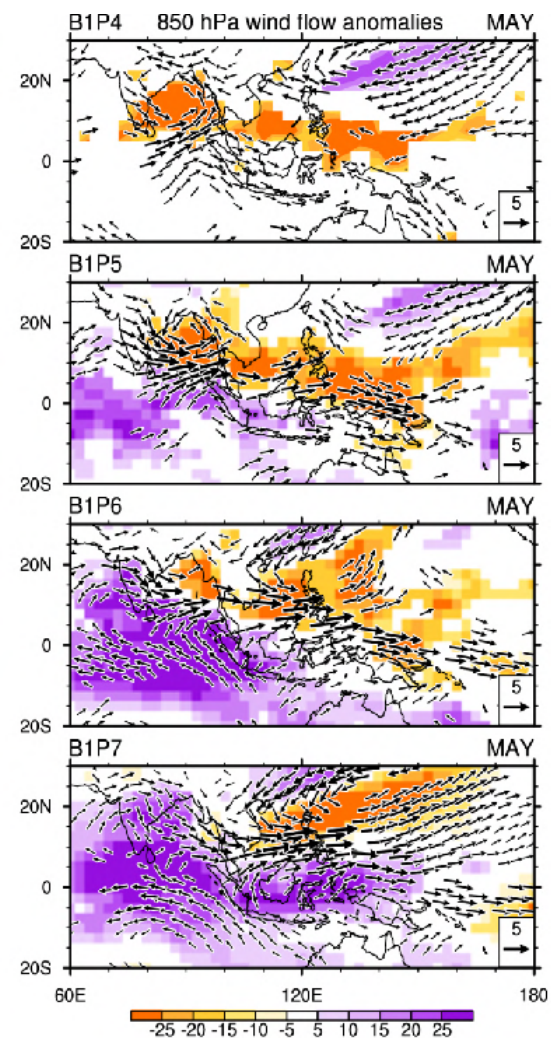

BSISO can contribute to the favorable condition in making strong Indo-China monsoon and bringing extra precipitation to TMD.

Forecast skill assessment

ECM Forecast Skill

Probability forecasts of heavy rainfall in Mekong river basin show *improvements over 30-50%* relative to climatological forecast at the lead time of WEEK2.

Guidance

BSISO Forecast for **5Sep** 2013–24Sep2013

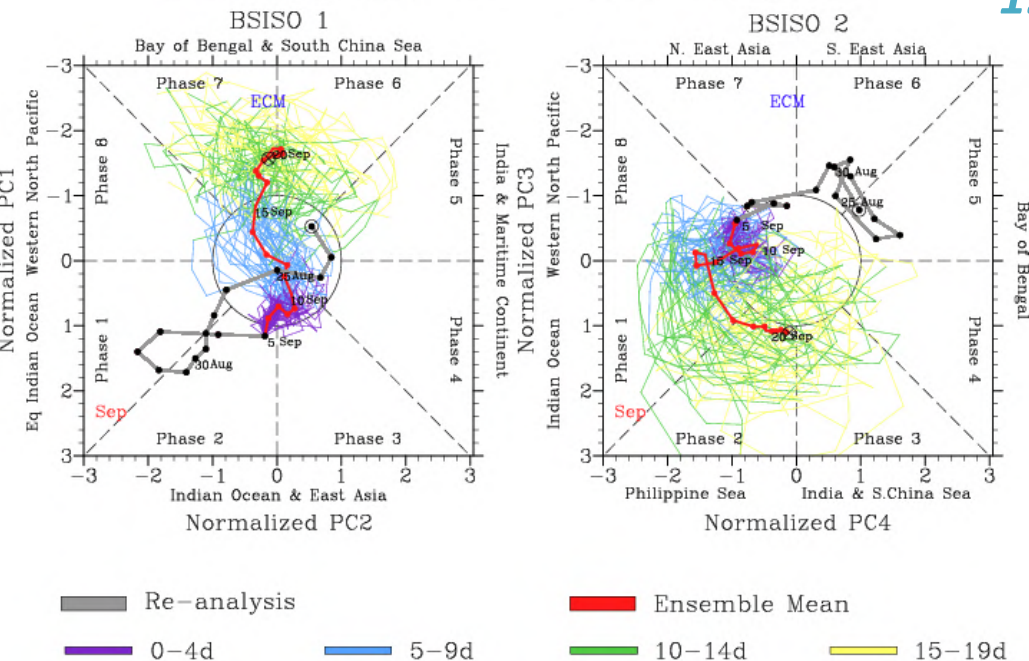

1. *Confirm the forecast of BSISO phase and amplitude for next two weeks*

→ 15-20Sep2013

B1P7-6, B2P1-2

Guidance

BSISO Forecast for **5Sep** 2013–24Sep2013

1. *Confirm the forecast of BSISO phase and amplitude for next two weeks*

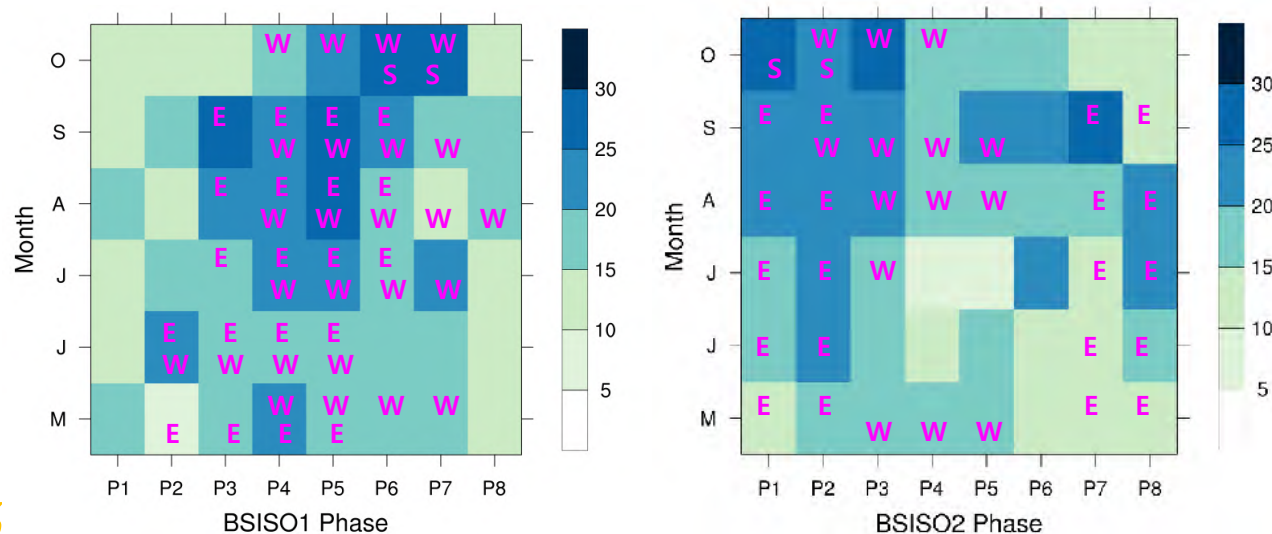

→ 15-20Sep2013

B1P7-6, B2P1-2

2. *Find the relationship btw BSISO phase and heavy rainfall probability in the research report.*

→ B1P7-6 (Sep) W,E ~20%

B2P1-2 (Sep) E,W ~25%

Guideline

3. For easier viewing,
you can go to **heavy rainfall probability forecast map in the APCC website.**

ECM Forecast

WEEK1

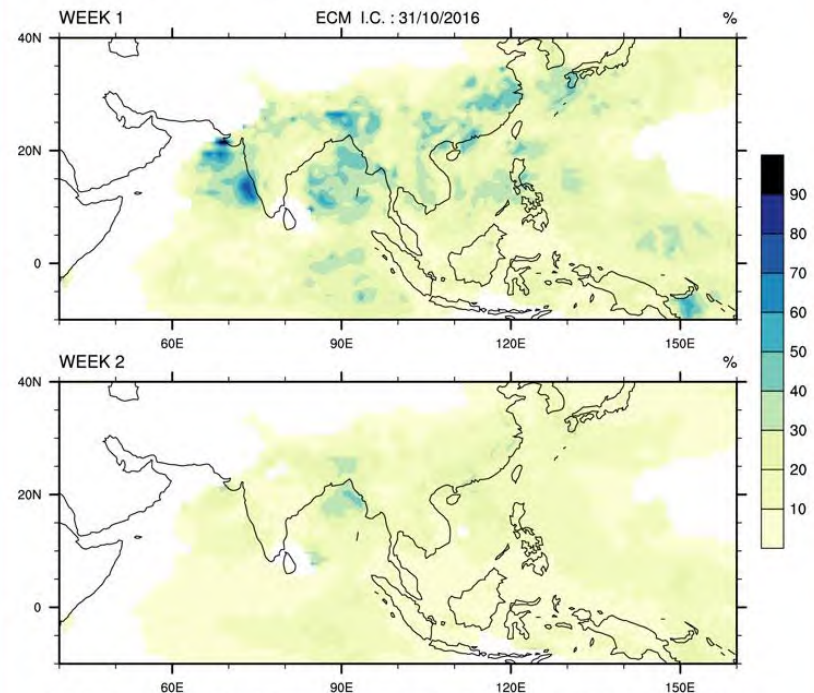

WEEK2

BOM CFS GFS UKM **ECM** CWB

Probability of heavy rainfall determined by predicted BSISO

Probability of occurrence for heavy rainfall event as defined by daily rainfall exceeding the 90th percentiles value (21.4 mm/day) for Oct. during 1981-2010.

© APEC Climate Center

Guideline

4. If you want to know the cause of easterlies and circulation pattern ..
Look up it in the **mechanism** chapter or Appendix.

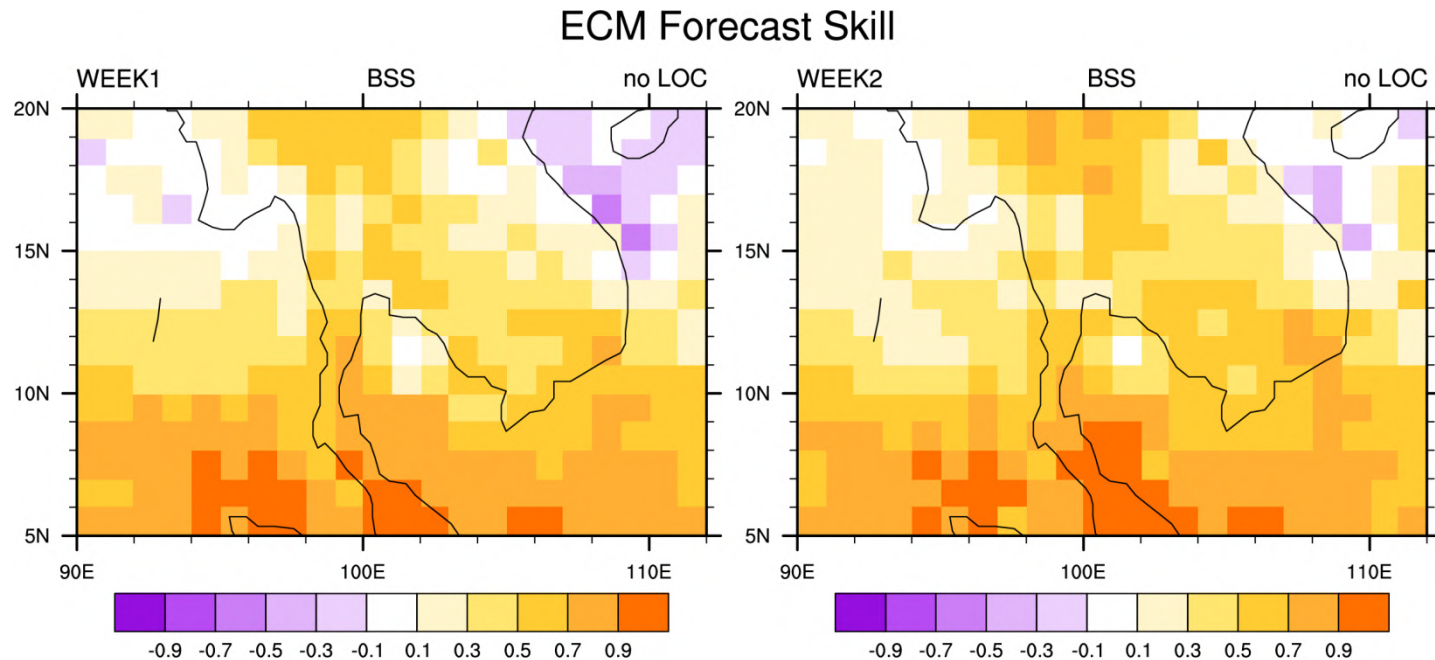

→ Indo-china peninsular has favorable condition for having easterly (westerly) wind due to a strong convective cell (anticyclonic cir.) located on the Philippine sea and the northwest Pacific (the Indian Ocean).

Guideline

5. There are some points to be duly considered.

→ Probability forecasts of heavy rainfall at 1-week and 2-week lead show improvements of 30% - 50% relative to climatological forecasts over the Mekong river.

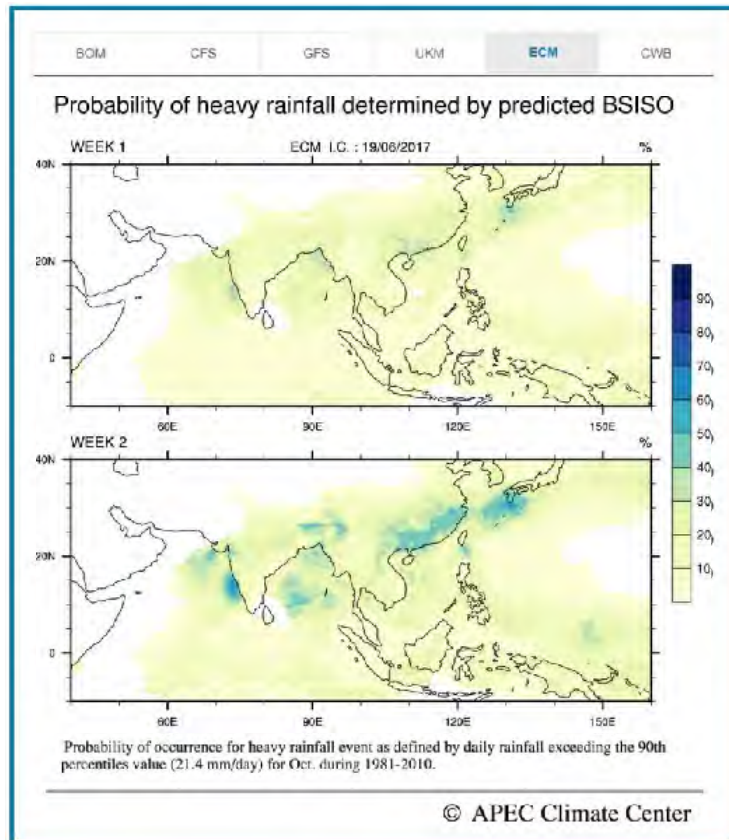

Better forecast from better recognition of the value

Development of a guideline to increase practical use of BSISO forecast

**Heavy rainfall forecast
based on BSISO index forecast [ECMWF]**

TC development in conjunction with El Nino/MJO

EL NINO MEETS MJO

When atmospheric and oceanic oscillations combine

By Chris Borg

Published: July 8, 2015

Views: 12,189

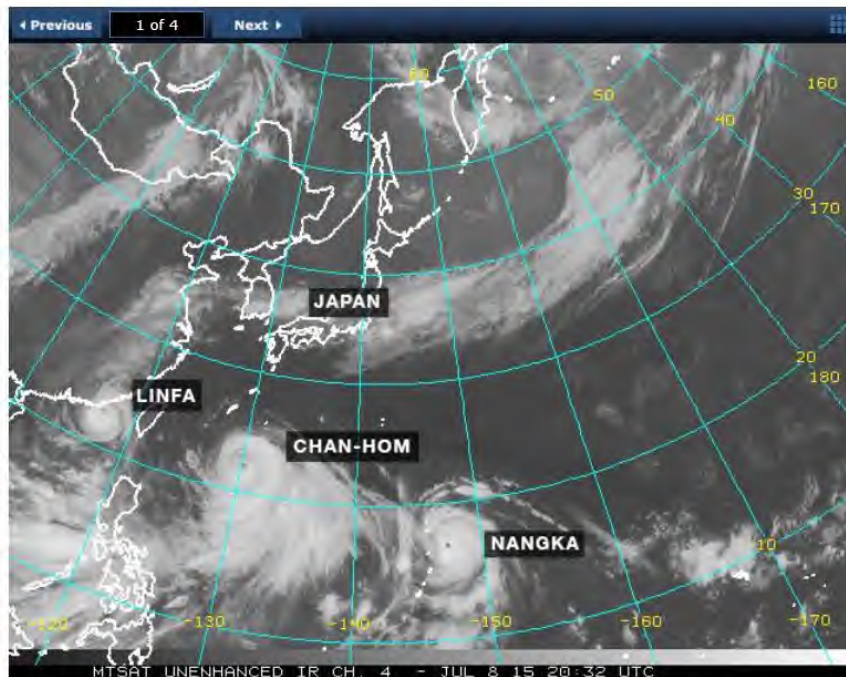

The words "El Nino" have made their way back into the news over the last few months by slowly, but surely, warming up waters of the tropical Pacific.

Now that El Nino has strengthened and is on the verge of breaking some temperature records in the central tropics, the world's best known atmospheric/oceanic event is being credited with causing nearly every weather anomaly anywhere in the Pacific. Of course not all of those claims are valid. While El Nino is definitely the star of the show, there are other players involved too. Like the MJO, for instance.

Handhu Fahli: Male Atolls

Source: Chris Borg, Surfline

The West Pacific tropics are going looney right now thanks primarily to the active phase of the MJO, but also to strengthening El Nino conditions. Image courtesy of NOAA.

BSISO-TC activity relationship

Is there any relationship between strong BSISO activity and TC activity in 2015?

Can BSISO forecast give some information on early detection for typhoon formation?

→ *BSISO-WP TC relationship*

: Focused on the *TC related variables* (e.g. Nolan et al., 2007; Camargo et al., 2000)

Absolute vorticity at 850 hPa, relative humidity at 700 hPa, maximum potential intensity, vertical shear between 850 and 200 hPa, Genesis Potential Index

Here is an interesting cyclonic formation in the Indian Ocean (see the attached image). One each in the Arabian Sea and Bay of Bengal and two more just south of the equator. Are they all interconnected? Any comments on this particular formation? I see that there are some studies on cross-equatorial twin cyclones, where each cyclone impact the growth and track of the other cyclone.

Here is one study: <http://onlinelibrary.wiley.com/doi/10.1029/2000JD000066/full>

Roxy

I am jumping in to discussion rather late. What you have shown is cyclonic circulations and not the cyclonic formation. These do not have vertical continuity in the vorticity field. These are not seen on the next days chart also. Such cyclonic circulations are seen to present every day on the Indian land area at lower and middle troposphere. These are formed by conversion of shear vorticity into curvature vorticity and from energetic's point of view K_z to K_e conversion. Sometimes these are formed due to meeting of winds from two directions which produces convergence and vorticity. These do not have vertical structure like lows, depressions. Their lifetime is also small (one day). They do not travel much.

jrk

Hi All,

Please see below the CFAN forecast for eminent TC approaching Bangladesh.. **Surprisingly, no warnings from IMD, BMD, Bangladesh FFWC or RIMES.** This is alarming (and disappointing) given that the CFAN EC-based forecast suggests a severe TC landfalling within 3 days!.

I will keep you posted. PW

Sub: Depression over Central Bay of Bengal.

Latest observations & satellite imagery indicate that a depression has formed over central Bay of Bengal and lay centred at 0530 hrs IST of today, the 28th May, 2017 near Latitude 14.0° N and Longitude 88.5° E, about 950 km south of Kolkata and 980 km south-southwest of Chittagong. The system is very likely to move north-northeastwards and reach Bangladesh coast by 30th May 2017 forenoon. It is very likely to intensify into a deep depression during next 24 hours.

Warning:

- (i) **Wind warning:** Squally winds speed reaching 40-50 kmph gusting to 60 kmph would prevail along & off Andaman Islands and adjoining Sea areas during next 48 hours.
- (ii) **Sea condition:** Sea condition would be rough to very rough along & off Andaman Islands during next 48 hours.
- (iii) **Fishermen Warning:** Fishermen are advised not to venture into sea along & off Andaman Islands during next 48 hrs. Fishermen out at sea are advised to return to the coast.

The next bulletin will be issued at 1130 hrs IST of 28th May 2016.

OBSERVED POSITION AND FORECAST TRACK OF DEPRESSION OVER BAY OF BENGAL BASED ON 0000 UTC OF 28TH MAY, 2017

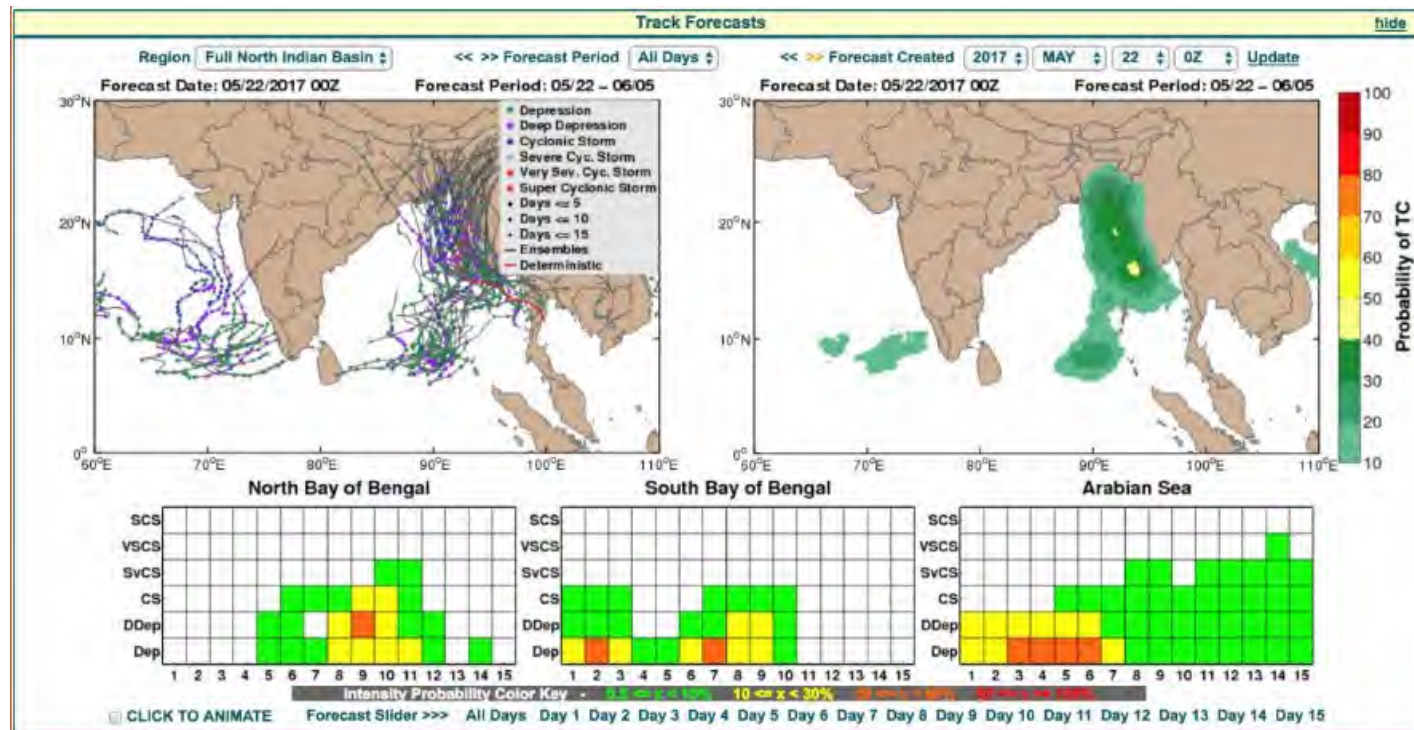

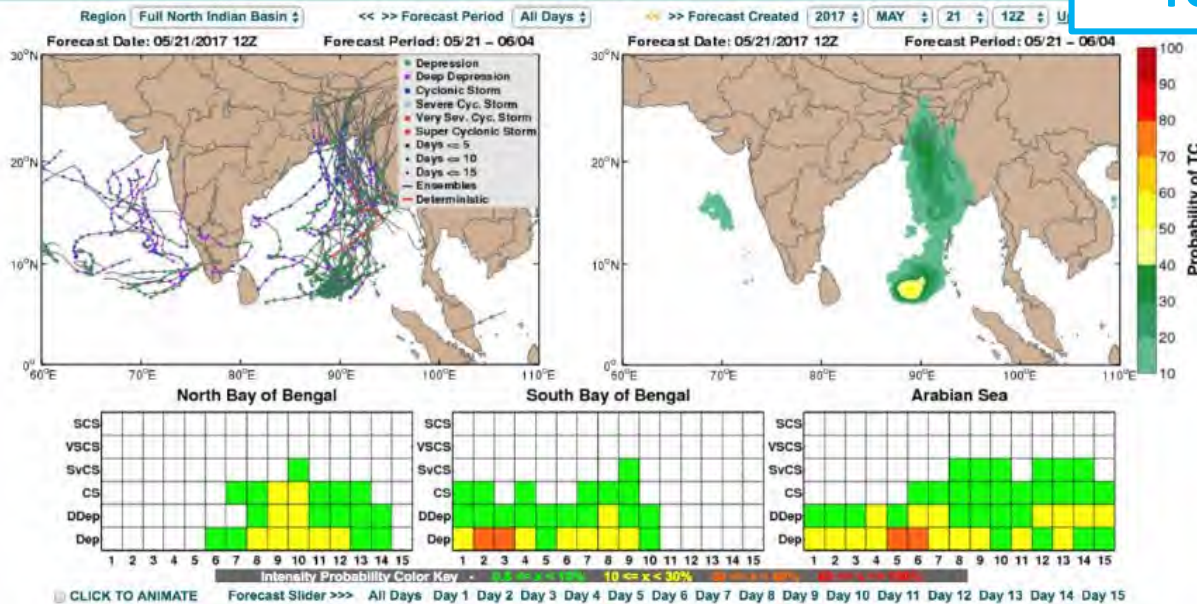

Dear All,

Related to this I would like to bring to your notice that IMD/Regional Specialized Met Center New Delhi had indicated in their morning Bulletin of **26th May with 51% to 75% probability of cyclogenesis in next 48 to 72 hrs**. Thereafter regular bulletins are being issued with raising probability to **76% to 100% on 27th morning**. Latest Bulletin is copied below. You may refer website www.rsmcnewdelhi.imd.gov.in for updates.

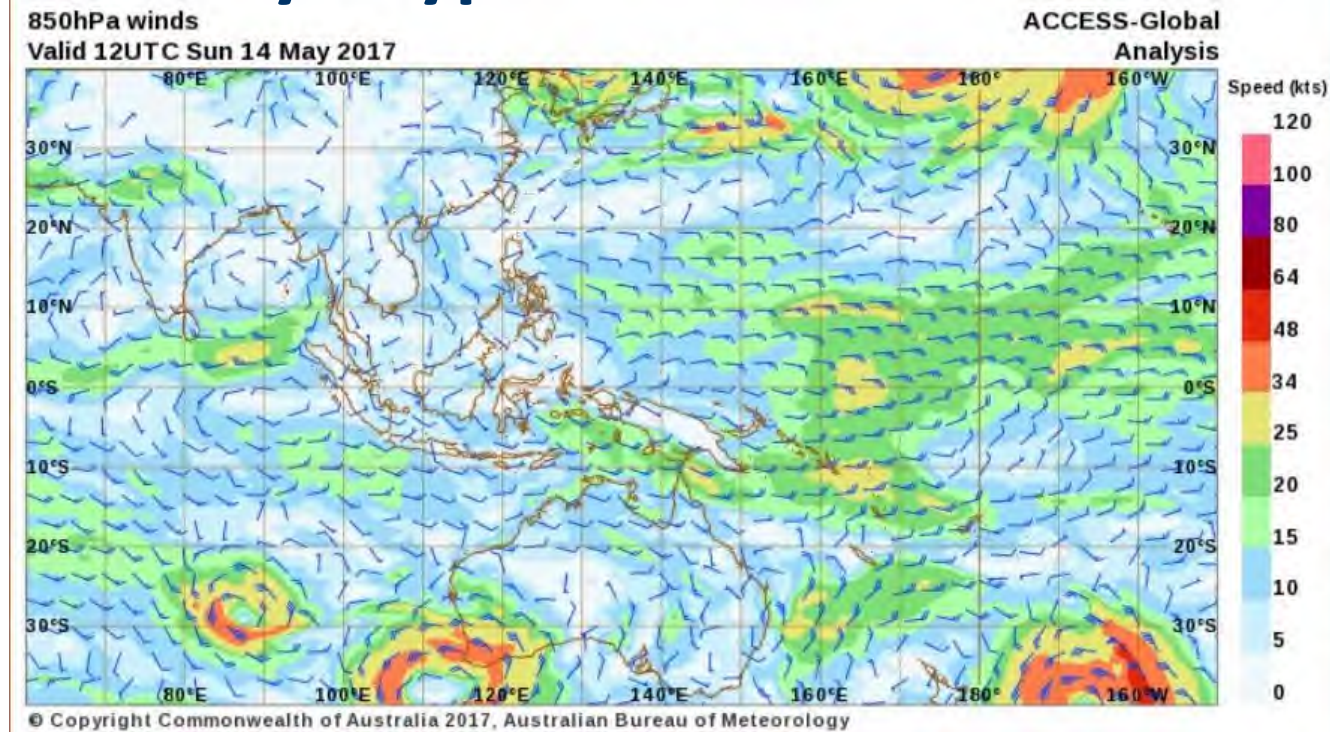

Sharing forecasts/warnings are most welcome. Let us all work towards safer world by providing timely warnings.

With best wishes, Ajit Tyagi

Track Forecasts

Application Possibility : Typhoon

Hi,

The 850hPa wind jet in the equatorial Indian Ocean:

This low level wind jet in the Indian Ocean has been there, almost stationary, for two weeks now.

To illustrate I have attached three 850hPa analyses from 12UTC on 14 May, 24 May and 29 May.

This jet was the main synoptic feature associated with the very heavy rainfall on the South and Southwest coasts of Sri Lanka around 24-25 May, which led to the devastating flooding and loss of life.

In addition, it was the central westerly as part of the structure of the twin cyclones, one of which became tropical storm Mora.

The twin cyclones have been discussed a bit already, and as pointed out they have the dynamical structure of an $n=1$ Rossby Wave. Still, to me its mysterious. What has maintained this feature for so long? Why stationary? (Rossby wave embedded in a background westerly flow?).

What effect has such a sustained wind had on the underlying ocean?

Any dynamical insights out there?

I'll get out of your way

John McB

Application Possibility : Typhoon

BSISO-TC activity relationship

TC Lan (21)

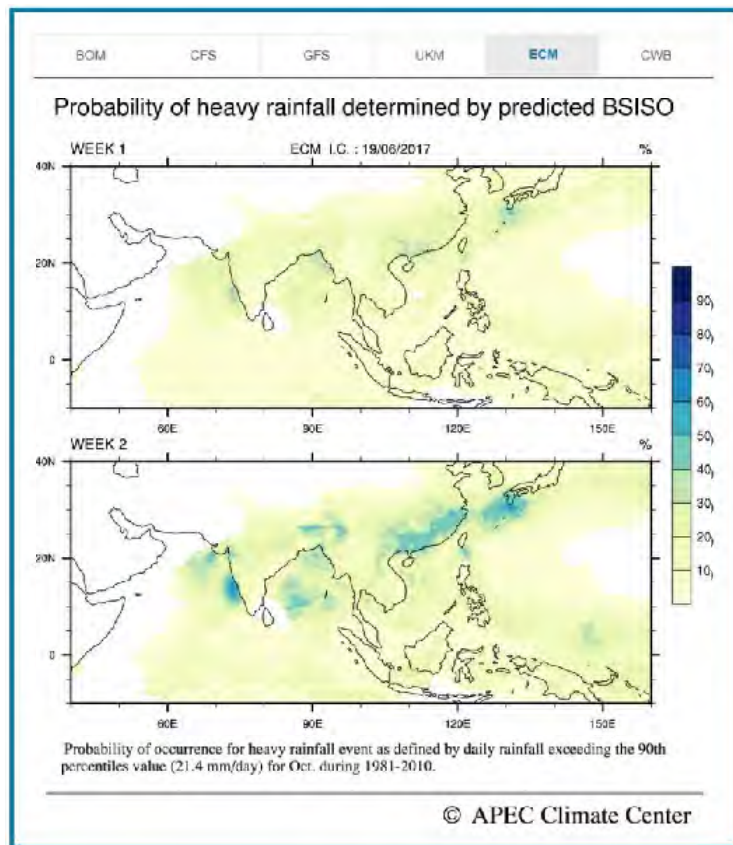

Better forecast from better recognition of the value

Development of a guideline to increase practical use of BSISO forecast

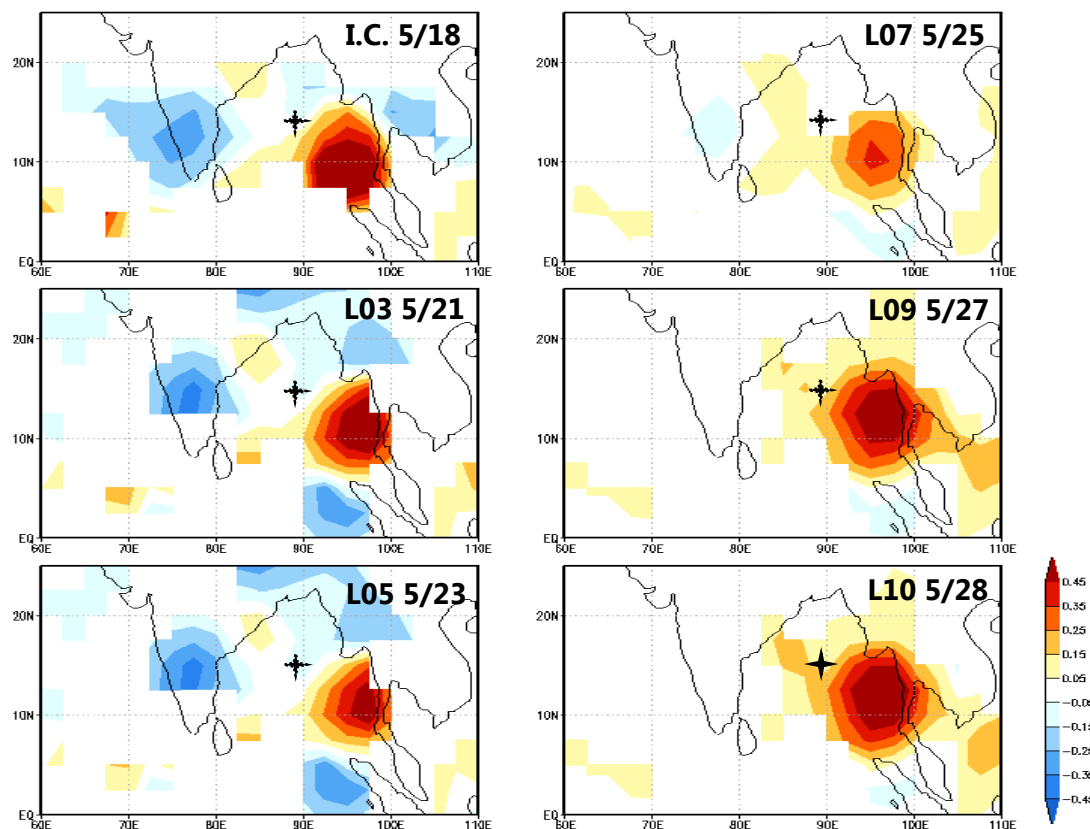

Heavy rainfall forecast based on BSISO index forecast [ECMWF]

- ❖ Ex> Japan flood, 398mm/4hr, July 6, 2017

ISGPI forecast estimated by BSISO index forecast [ECMWF]

- ❖ Ex> Tropical Cyclone Mora-17, May 28, 2017

Application Possibility

BSISO-extreme events relationship

'16

'17'18

'17'18

Thank you

Application Possibility : Typhoon

BSISO-TC activity relationship

WNP TC

Deterministic forecast (ISGPI)

Probability forecast of TC Occurrence

Ongoing research

When BSISO1 > 1.0 & P78 in Aug. for recent 10 years : 83 days
Among them, when TCs occur : 20 days
→ 24%

When BSISO2 > 1.0 & P1 in Aug. for recent 10 years : 47 days
Among them, when TCs occur : 10 days
→ 21%

BSISO-TC relationship

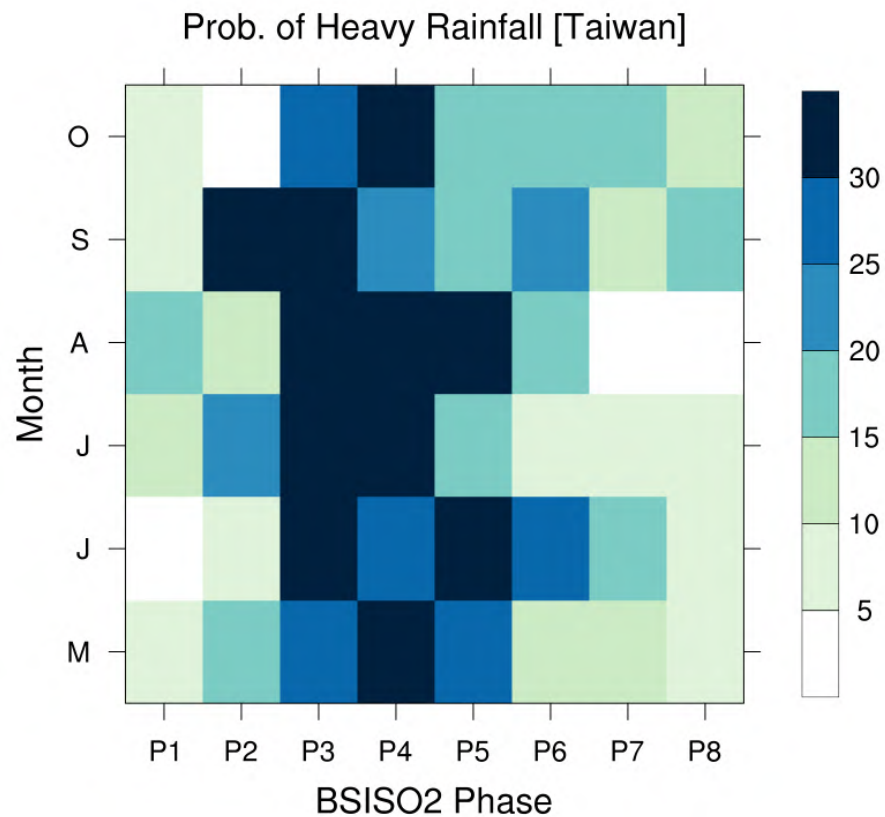

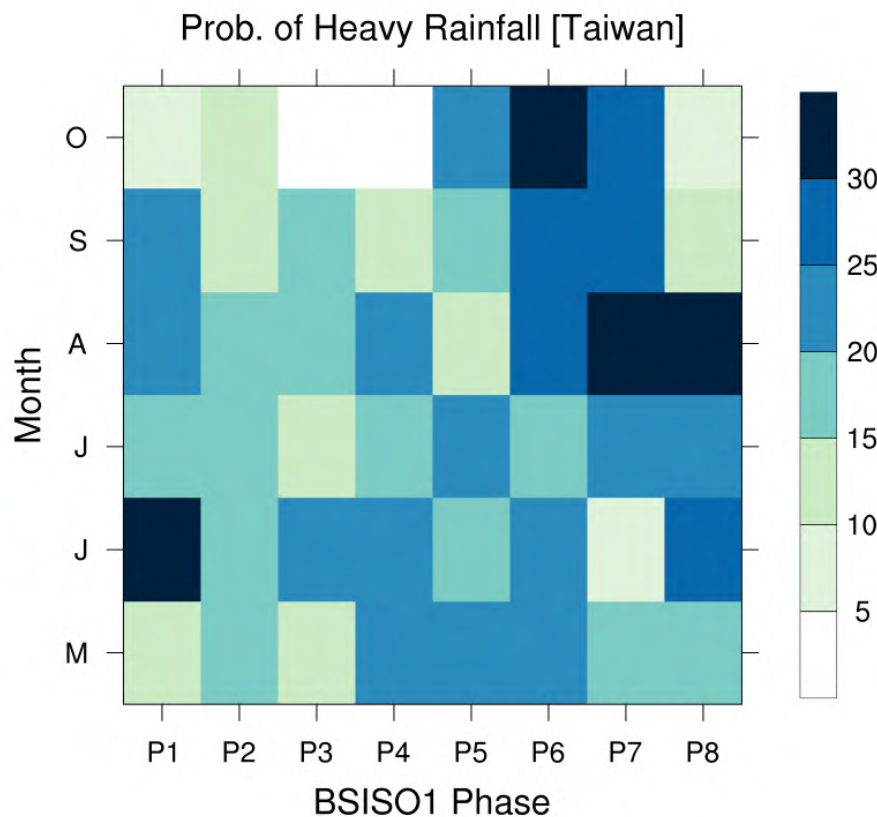

Better forecast? *practical use*

Relationship analysis (*Composite analysis : BSISO-Heavy rainfall probability*)

Probability of Heavy Rainfall occurrence [Taiwan]

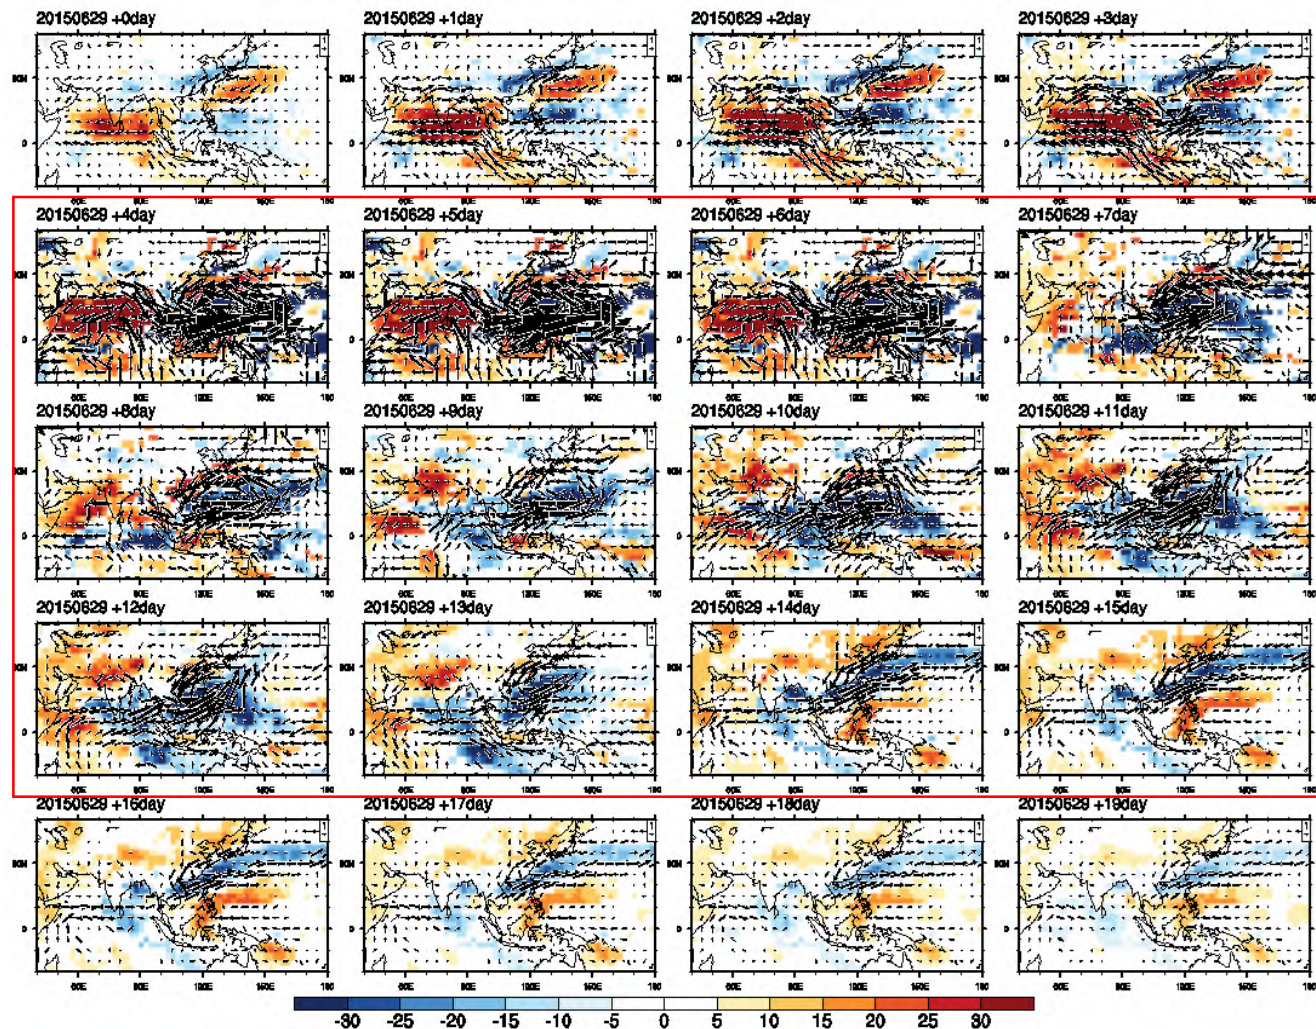

Application Possibility : Typhoon

BSISO-TC activity relationship

BSISO1+BSISO2 OLR&850hPa Wind anomaly (ECM) *Forecast*

9 : Chanhom
10 : Linfa
11 : Nangka

Application Possibility : S.Korea heatwave

BSISO-heatwave relationship

'17

폭염인 지점수가 30개 이상일 때 BSISO phase 에 따른 폭염일수
(한반도의 상당한 지역이 폭염으로 고생할 때 BSISO 와의 관련성)

(* 폭염지수 from 이우섭 박사 (1981-2014))

Application Possibility : S.Korea heatwave

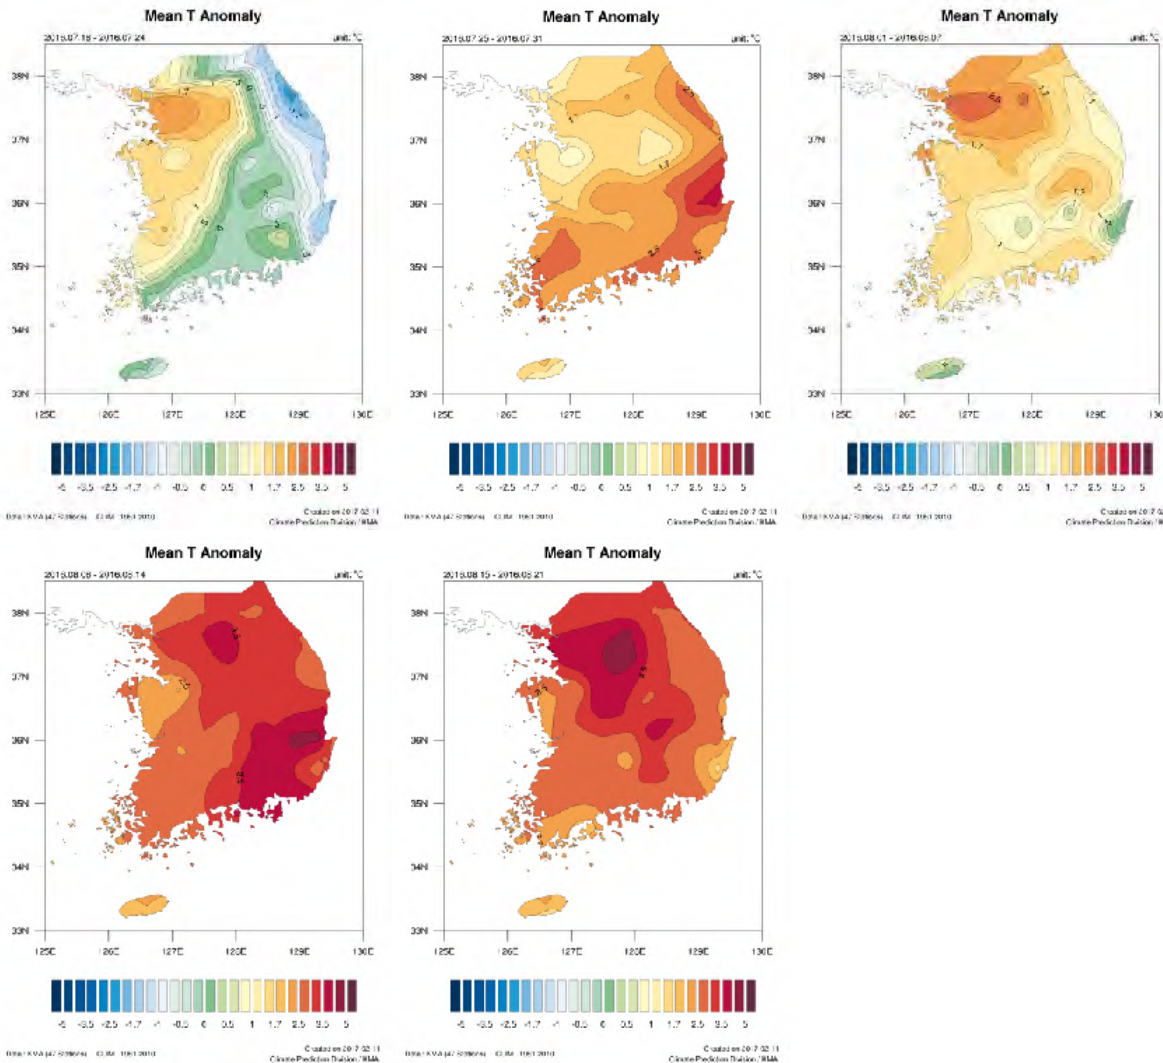

BSISO-heatwave relationship

Monitoring (7/12 ~ 8/20)

BSISO 1

Bay of Bengal & South China Sea

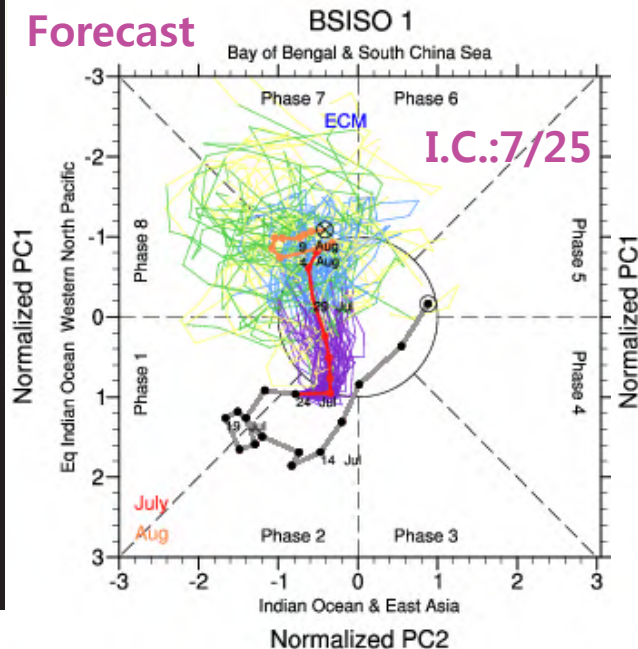

Application Possibility : S.Korea heatwave

Monitoring (7/12 ~ 8/20)

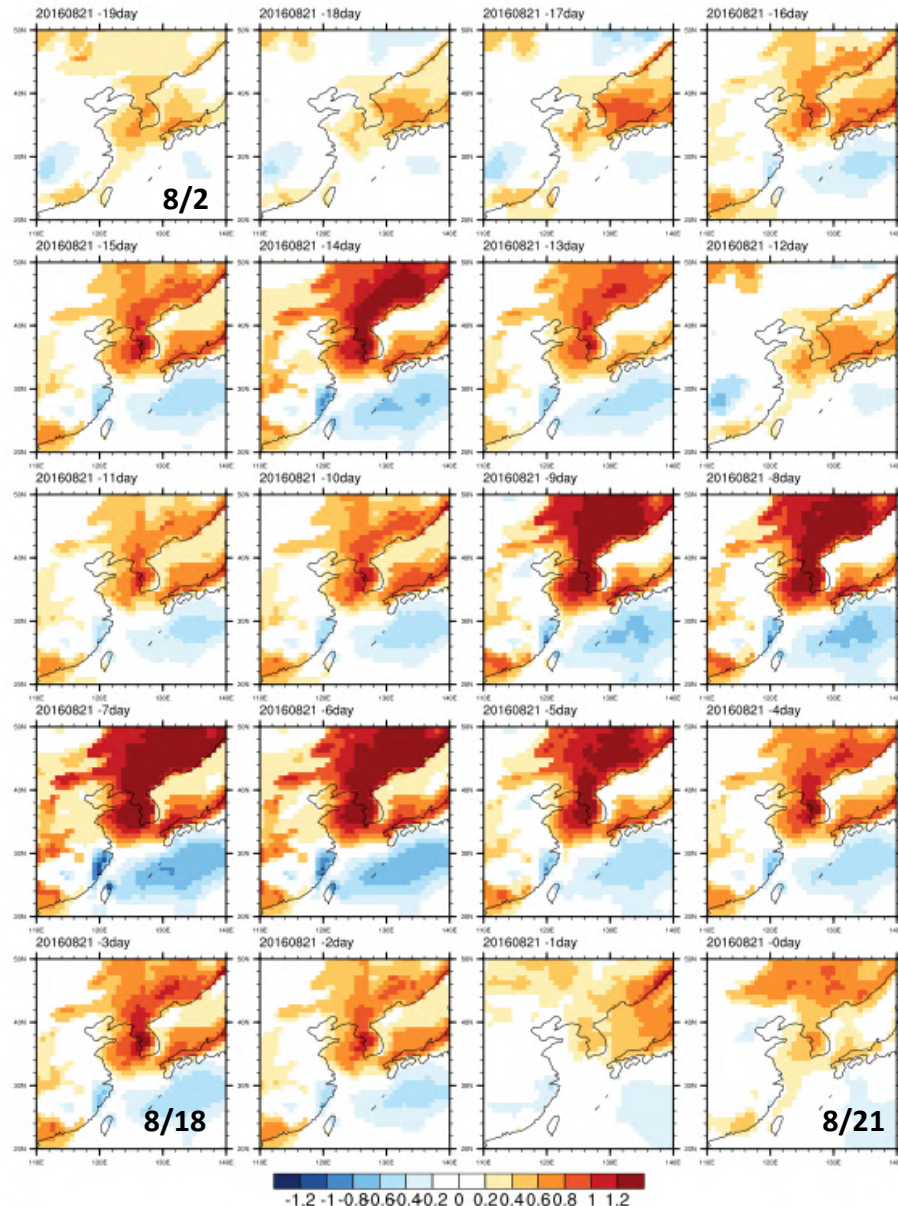

Forecast

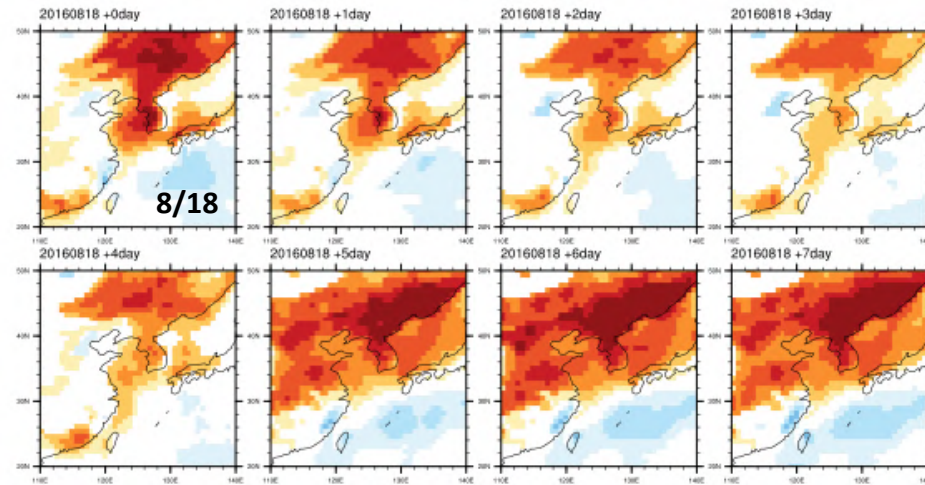

Application Possibility : S.Korea heatwave

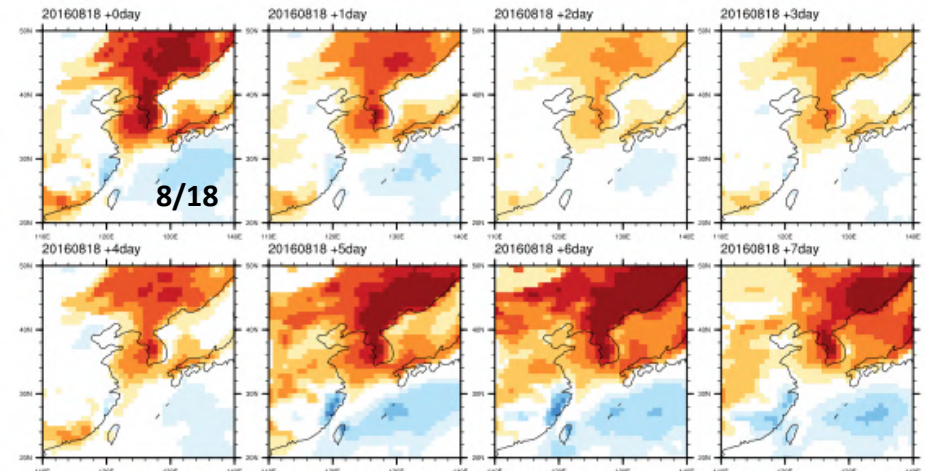

BSISO1+BSISO2 Temperature anomaly (MONITORING)

BSISO1+BSISO2 Temperature anomaly (BOM)

BSISO1+BSISO2 Temperature anomaly (ECM)

Application possibility [*S.Korea drought*]

Composite Analysis

1. 89 stations over Korean Peninsula
2. 1981~2010 (30yr)
3. MJJASO, **MAY**, JUN, JUL, AUG, JJ, JJA
4. Daily mean rainfall
5. over 1.5std of BSISO indices

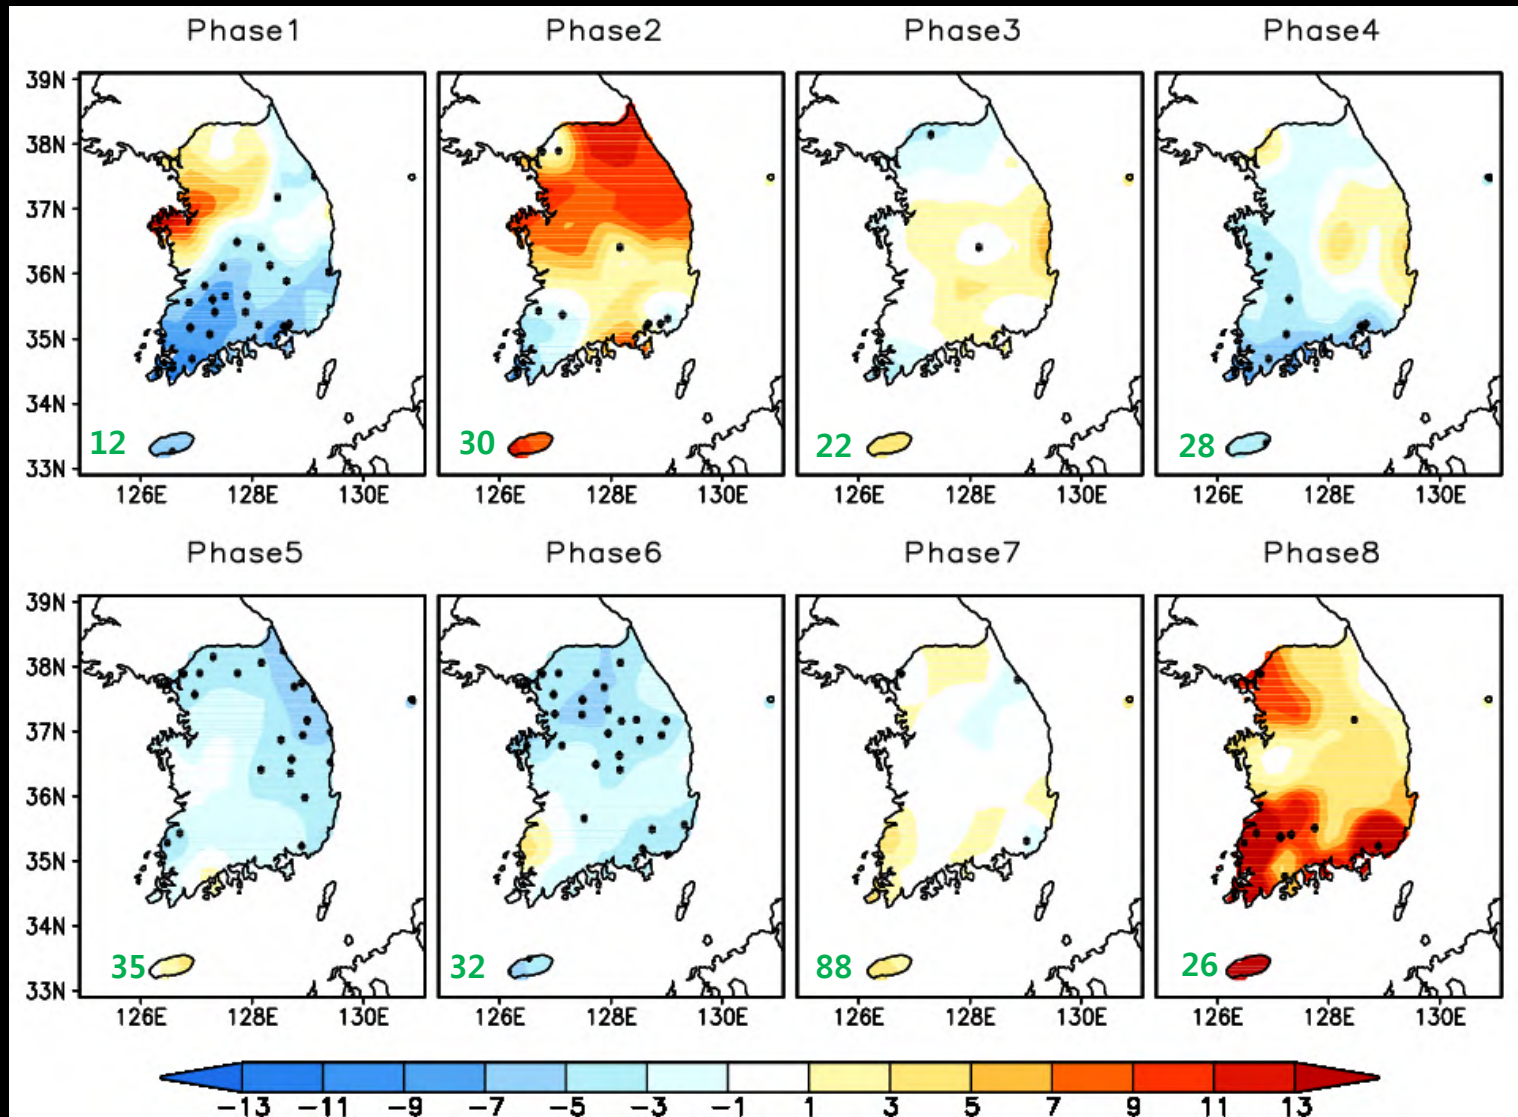

5월 (장마 전 건기)

: 겨울철 건기에 비해 강도는 약하지만 수자원 부족으로 농업을 비롯한 많은 산업에 피해를 초래

Application possibility [*S.Korea drought*]

Precipitation anomalies [*BSISO1:May*]

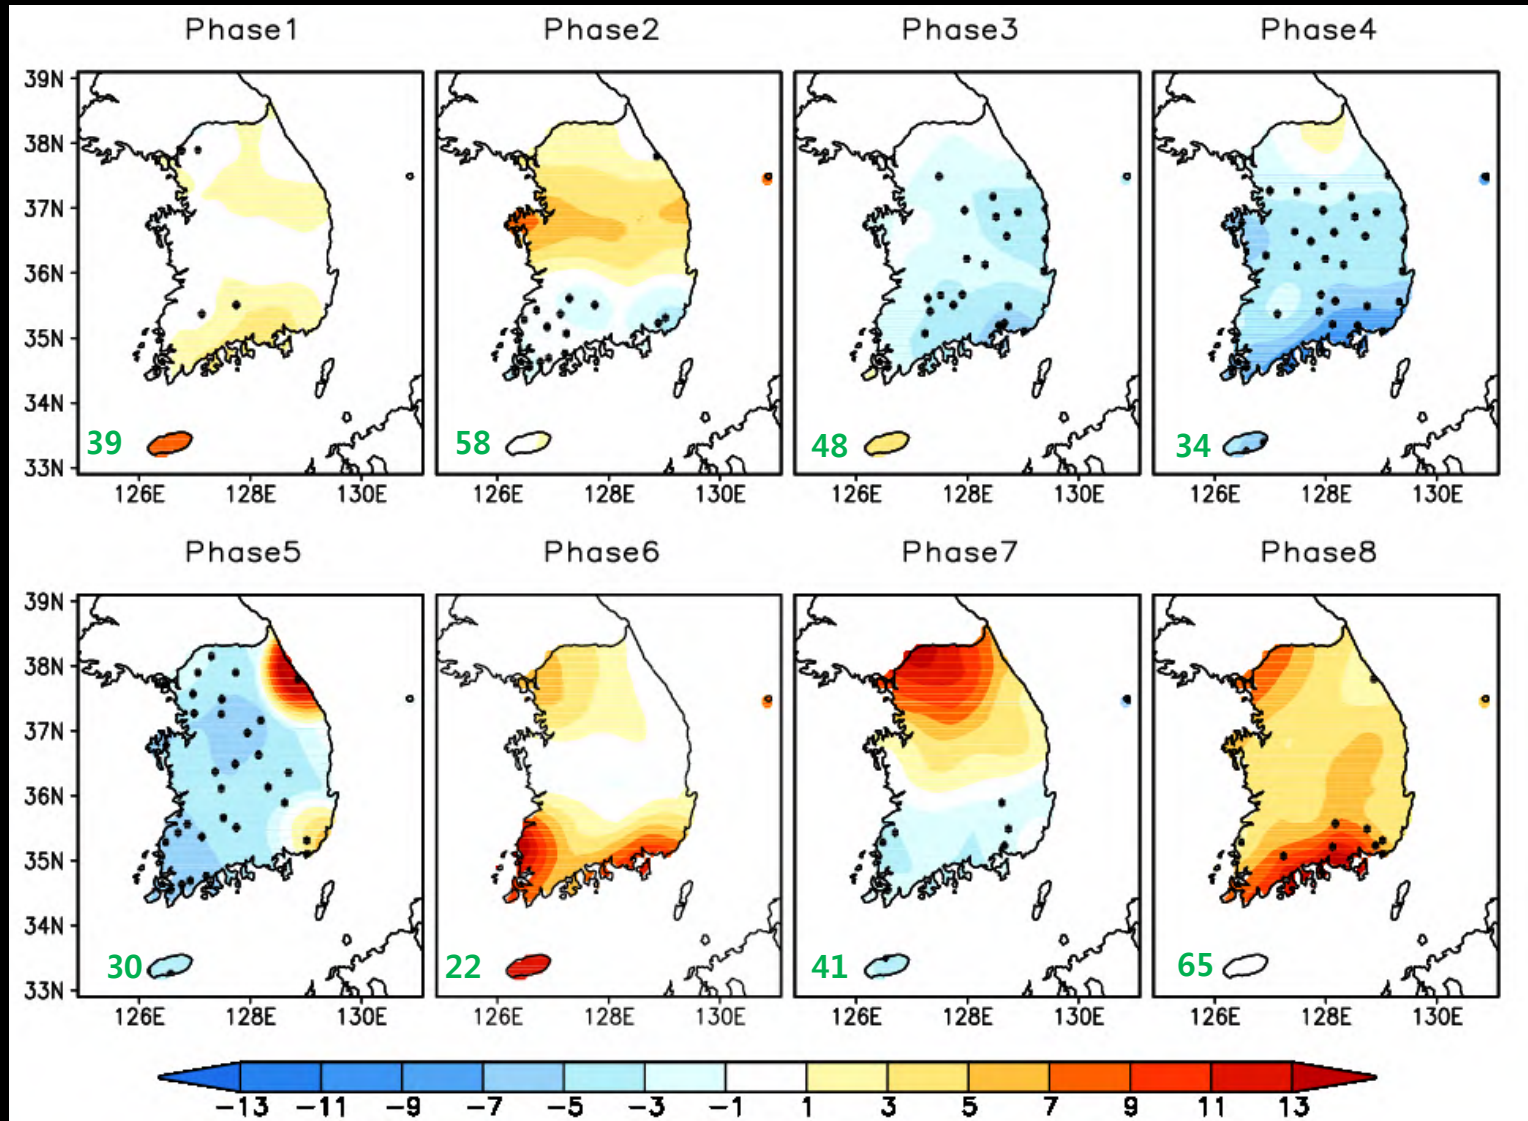

● black dot : station with significant value over 95% confidence level

Application possibility [*S.Korea drought*]

Precipitation anomalies [*BSISO2:May*]

● black dot : station with significant value over 95% confidence level

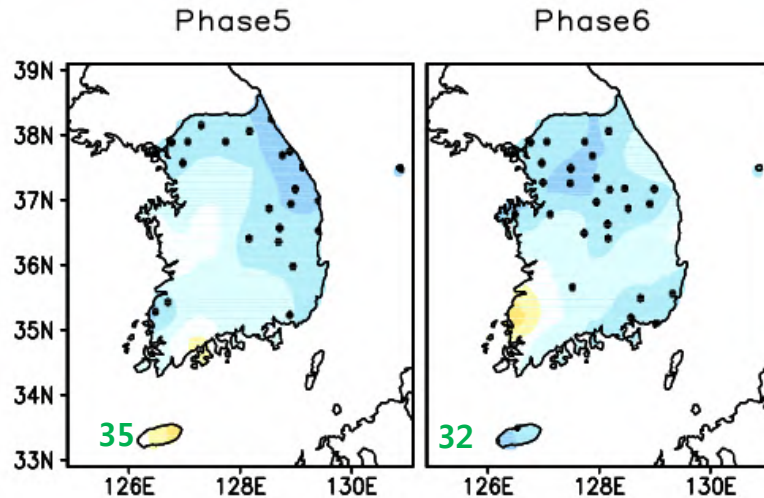

Application possibility [*S.Korea drought*]

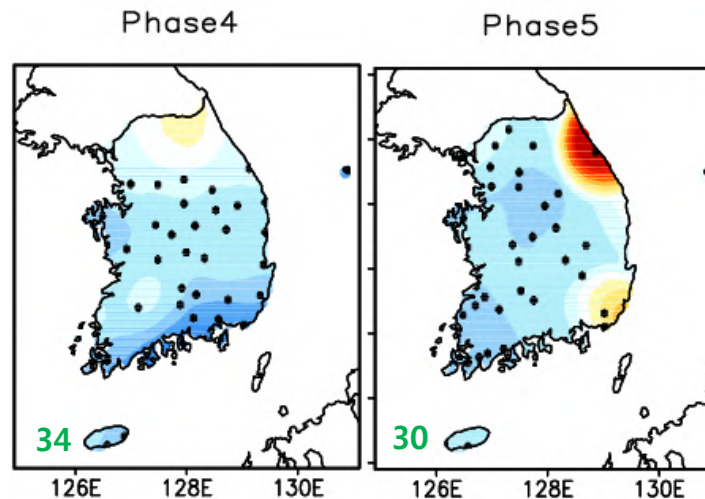

Precipitation anomalies [*BSISO:May*]

● black dot : station with significant value over 95% confidence level

BSISO 1

BSISO 2

Application possibility [*S.Korea drought*]

Northern Hemispheric Circulation Responsible for the Spring Drought in Korea

1. *Scandinavia teleconnection pattern*
2. *North Pacific teleconnection pattern*

(c) 3rd (5.8%)

(d) 4th (5.6%)

Reference [Kim et al., 2005]

Application possibility [S.Korea drought]

Case Study [2001:May]
